

Multi-Physics Modelling for Nuclear Engineering and other Applications

QMUL 2023

Dr Andrew G Buchan

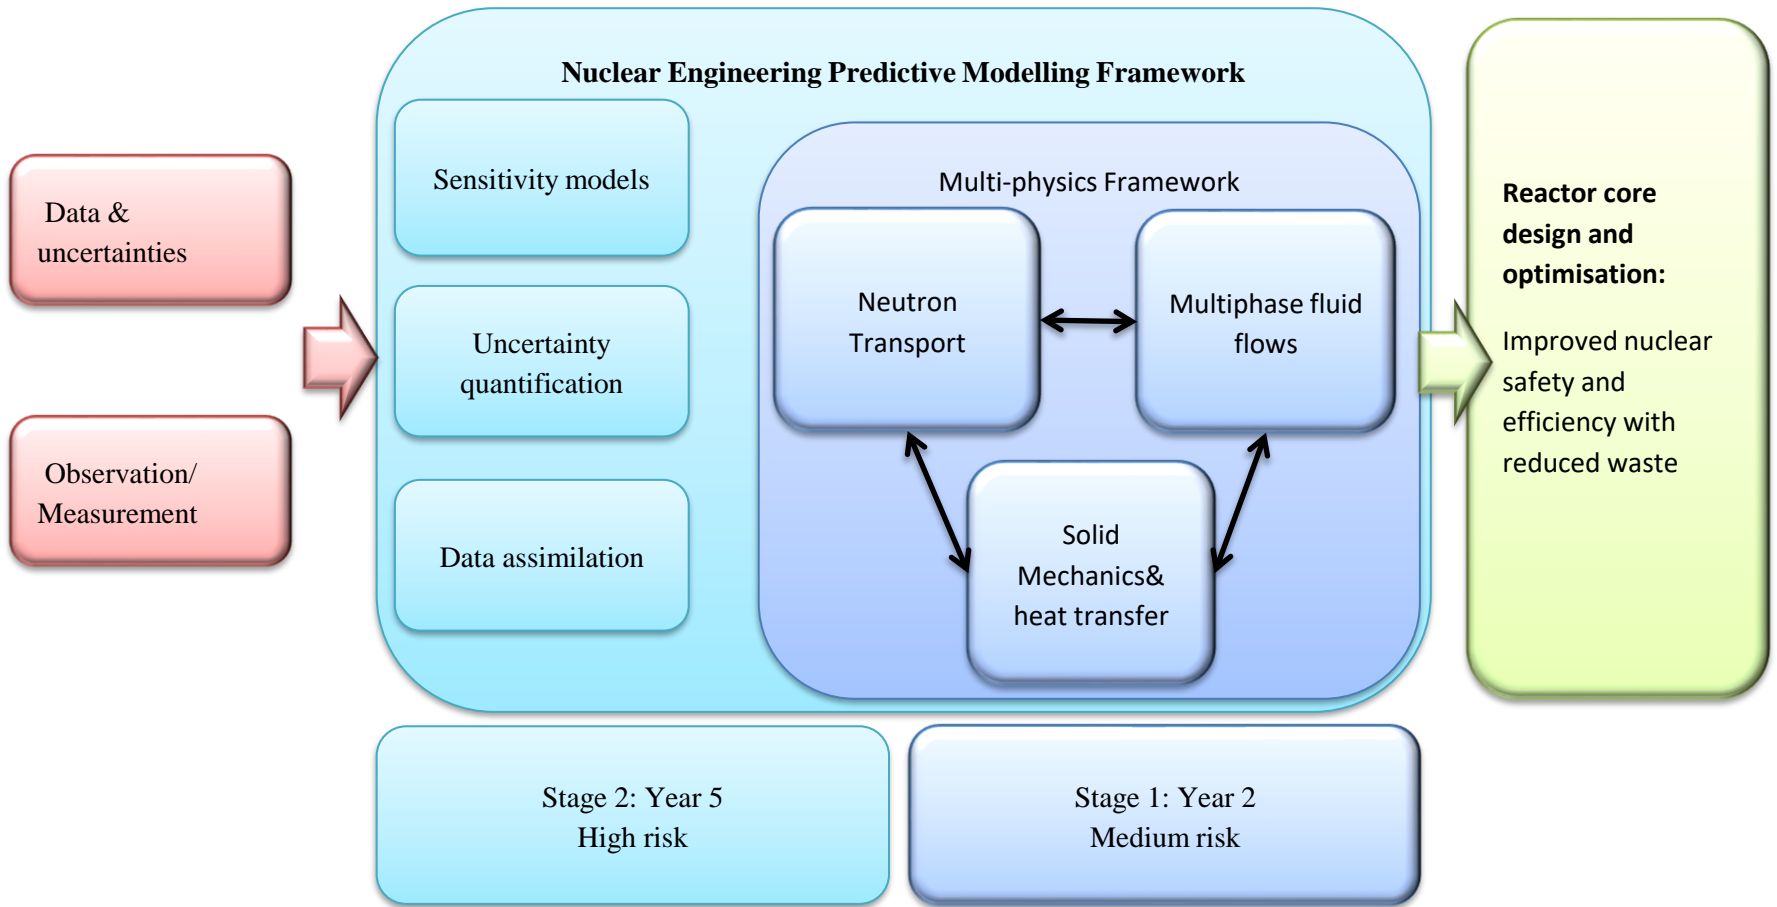

School of Engineering and Materials Science: QMUL

Alex Hughes (QMUL), Andrew Little (HMS Sultan)

Matt Piggott (ICL), C. Pain (ICL), S. Dargaville (ICL)

Outline of Presentation

- Overview of coupled physics modelling of radiation transport and fluid flow
- Neutron transport methods: mesh adaptivity, sensitivity analysis, reduced order models
- Coupled physics models: Reactor Physics, Environmental modelling , UVC disinfection
- Future directions
- Work uses several frameworks: FETCH, Wyvern and Firedrake – contributions from several institutions

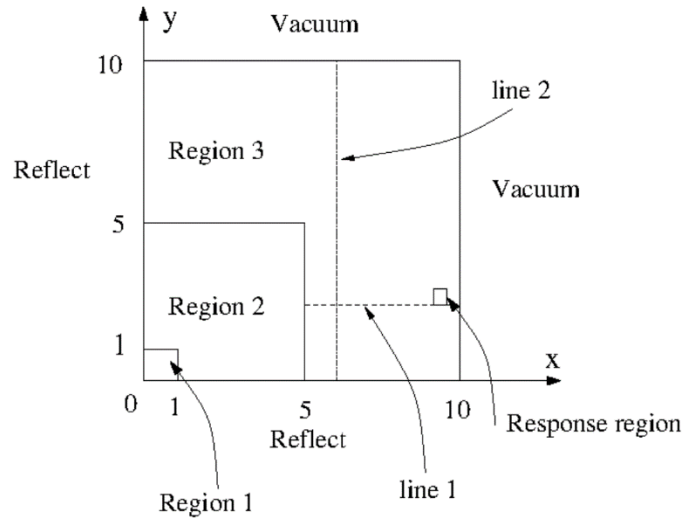

Neutron Transport Solver

NT models: unique combination of advanced numerical methods:

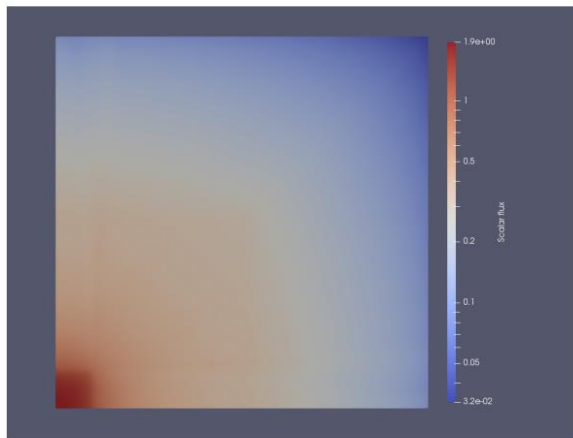

- Adjoint-based Self adaptive resolution
- Adjoint sensitivity models
- Parallel solvers
- Reduced order models

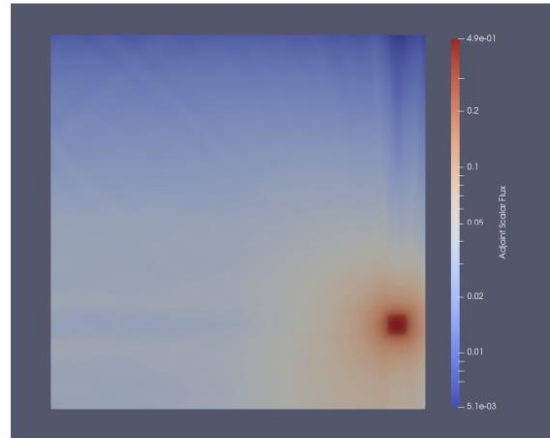

Adjoint Sensitivity & mesh Adaptivity

Adapted Mesh

Scalar flux

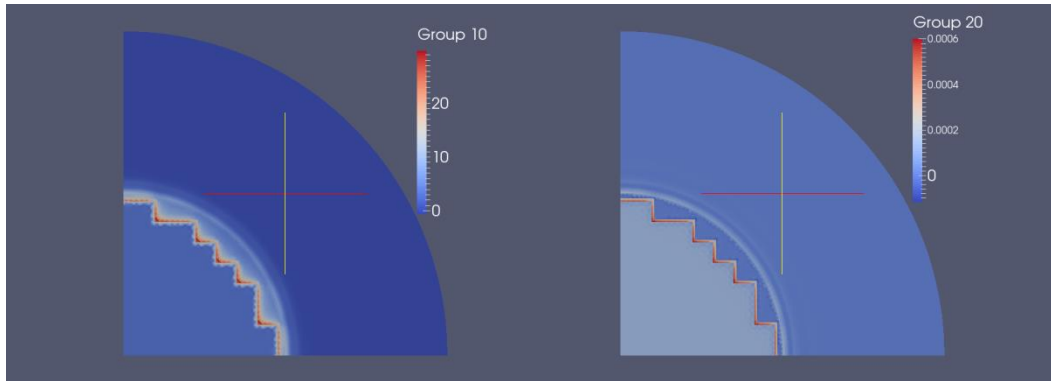

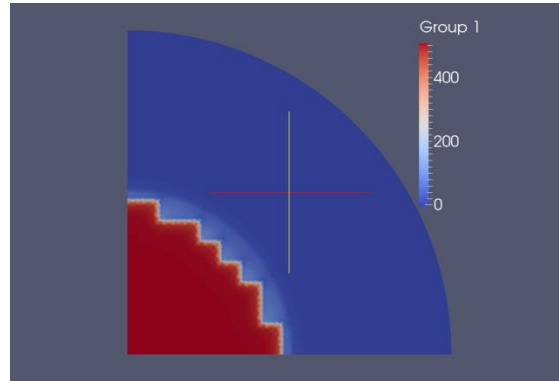

Adjoint Flux

Sensitivity Map

Adjoint methods for Large Scale Problems

Reduced Order Models

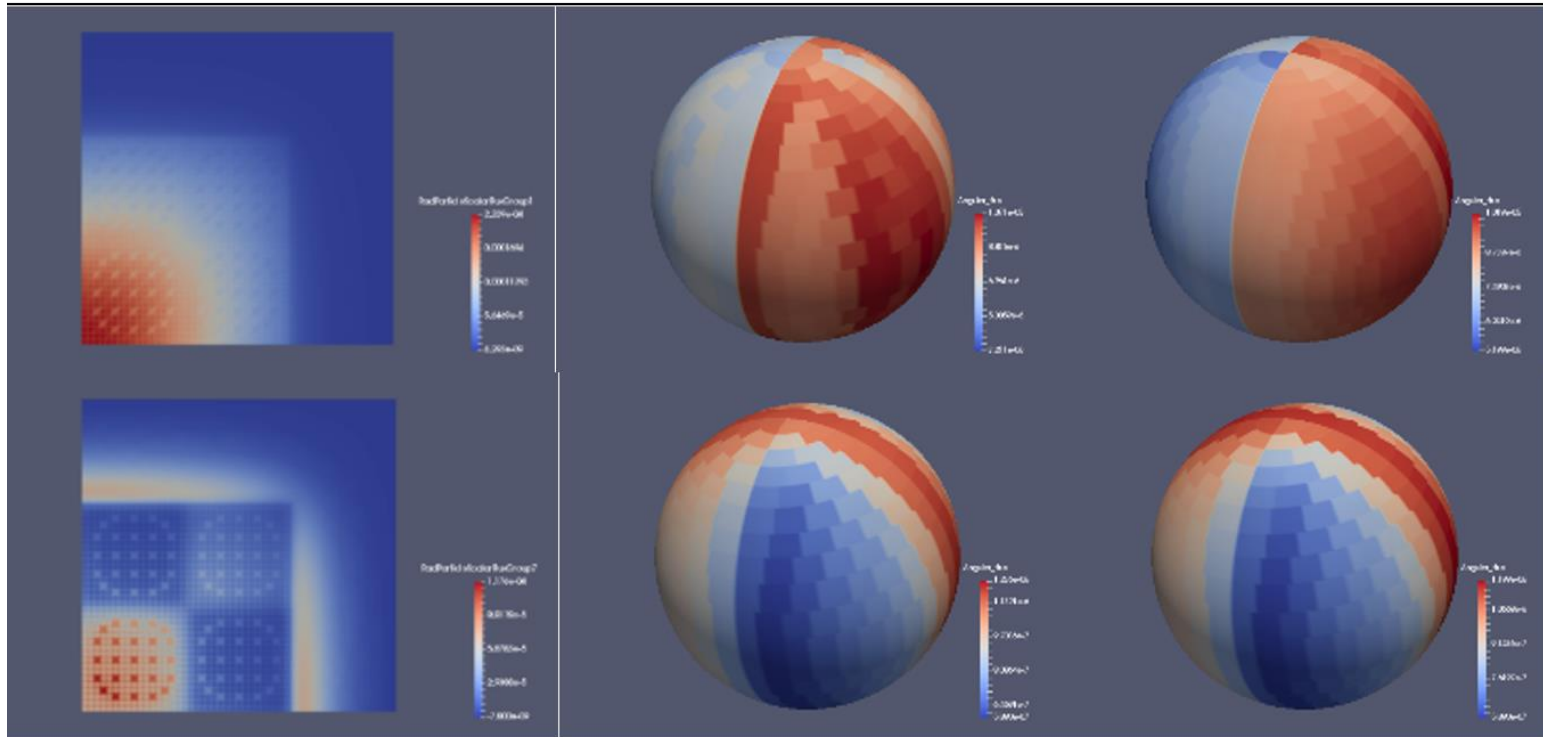

- BTE computationally expensive to solve
- Discretisations DOF: Angles = 1000s Space = 1000000s
- ROMs – form optimised basis functions – reduce DOF by orders of magnitude
- First Angular ROMs of NT

Reduced Order Models

Fast/thermal flux

Angular fluxes

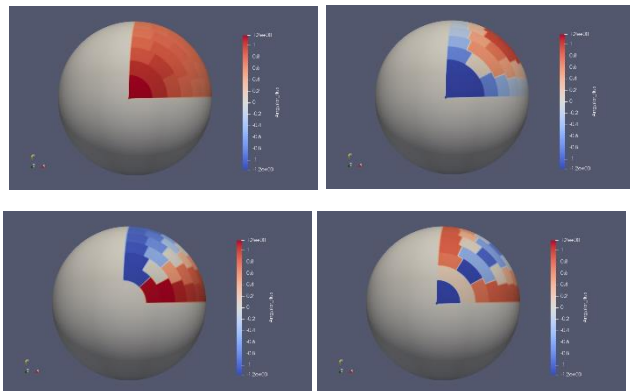

SN ($< 200s$)

ROM (6)

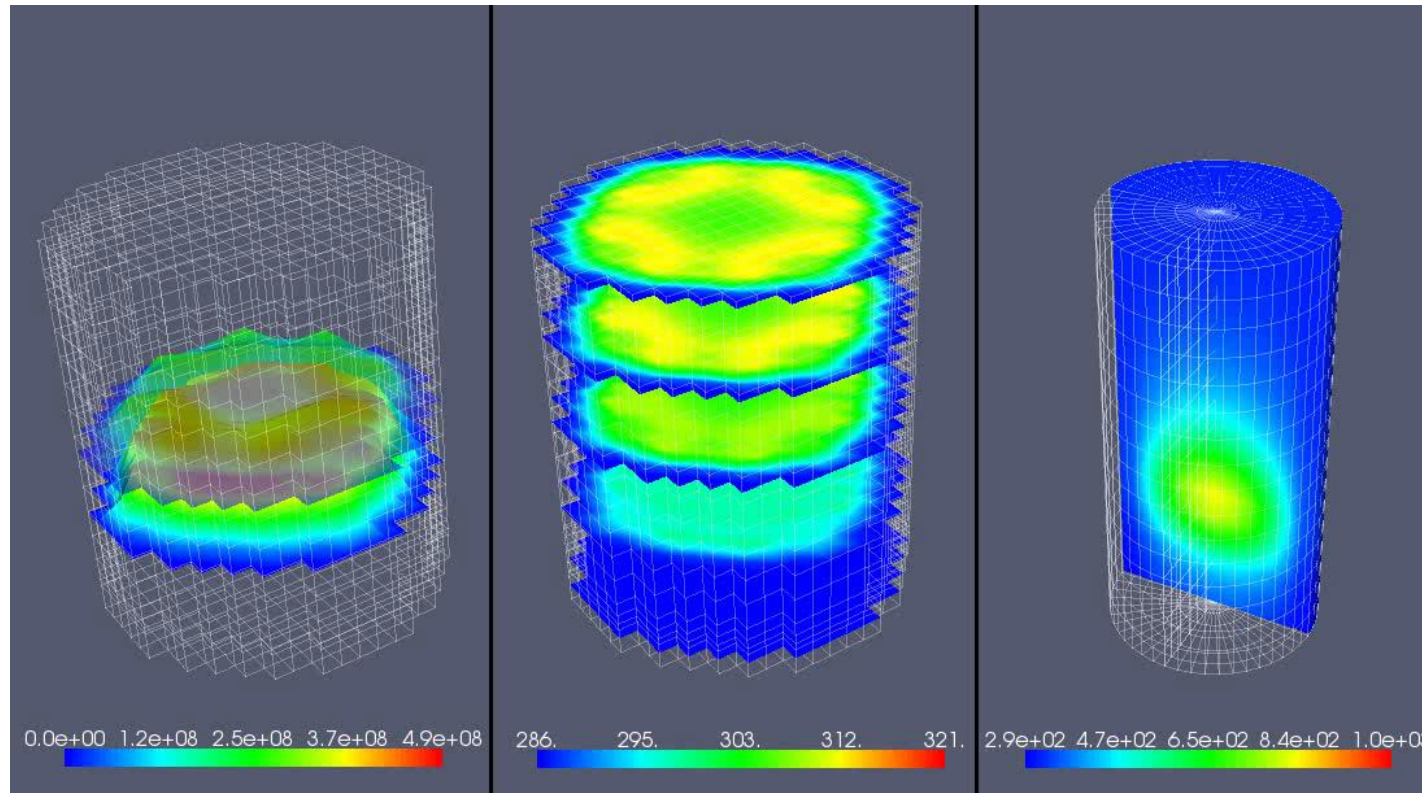

Typically 2 orders of size reduction

Space-Angle Reduced Order Models

1. Spatial ROMs resolve spatial dependence of Angular ROMS
2. Further reductions in size – 6 Orders of magnitude

Simulated Control Rod Ejection

Power

coolant temperature

fuel pin temperature

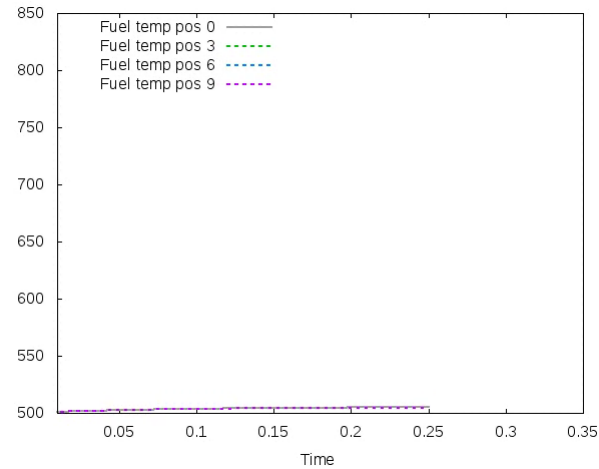

ROMs for Transients: Cold Slug Injection

Power

Fuel temperatures

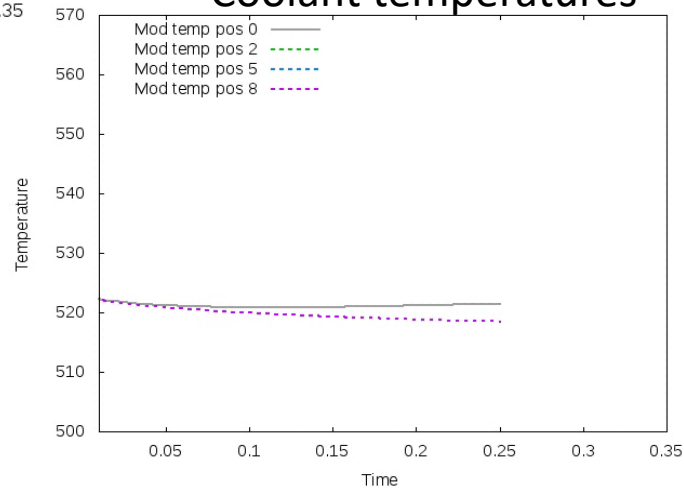

Group 2 Flux

Transient simulation:
fixed control rods
Inlet coolant reduced by 15C at
200 seconds

**This ROM simulations was
computed in seconds!**

Coolant temperatures

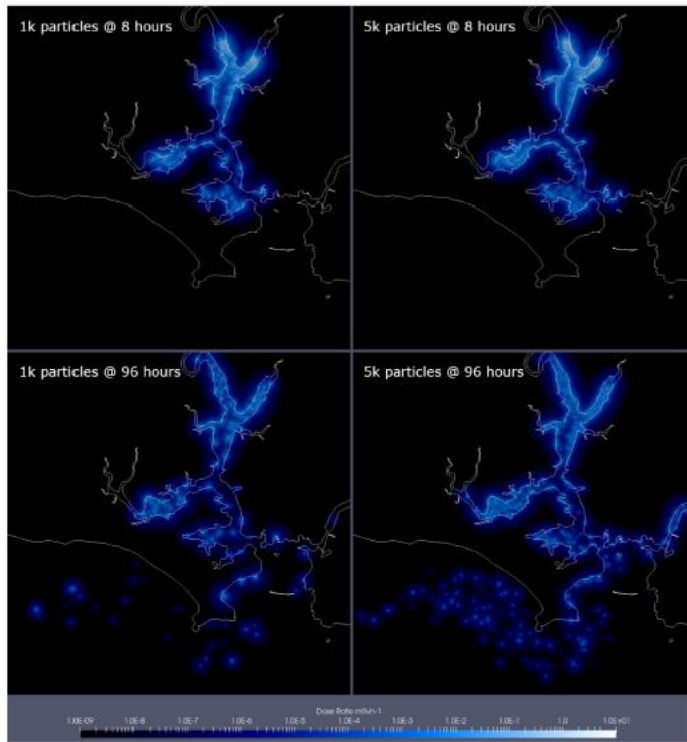

Coastal modelling radionuclide release monitoring

A Little (HMS Sultan, ICL) coastal modelling of radioactive release
Firedrake – unstructured FEM, parallel solvers, adjoint sensitivity,
particle modelling.

Gamma Shine dose calculatons

Track release dispersion – estimate gamma dose

Emergency response and managed release

Forming EPSRC proposal (managed release and accident predictions)

Looking for industrial partners

(working with Sellafield, EDF, Fukushima university)

Future Directions

AI-Based Reactor Physics Modelling

QMUL-Imperial-Sheffield

- Multi-physics reactor modelling using AI tools throughout
- Optimised for all computing architectures
- AI-differentiation tools for sensitivity analysis
- Data-Assimilation, Uncertainty Quantification, Digital-Twin.
