

Sustainable Computing

Prof Jonathan Hays

NetDRIVE Meeting

Queen Mary University of London, 18th February 2025

Sustainable, adj.

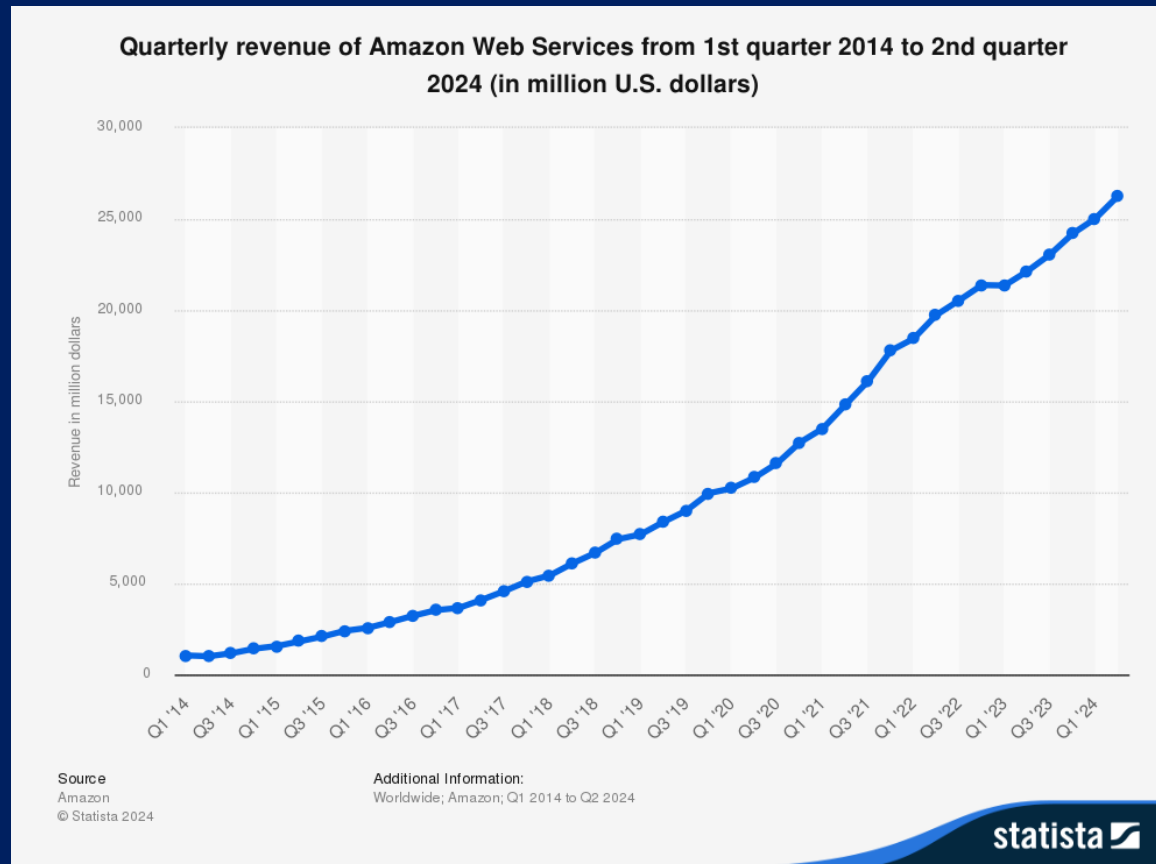

Capable of being maintained or continued at a certain level or rate

Computing, n.

The action or practice of using computers, esp, as a professional or expert; the activity operation of an electronic computer

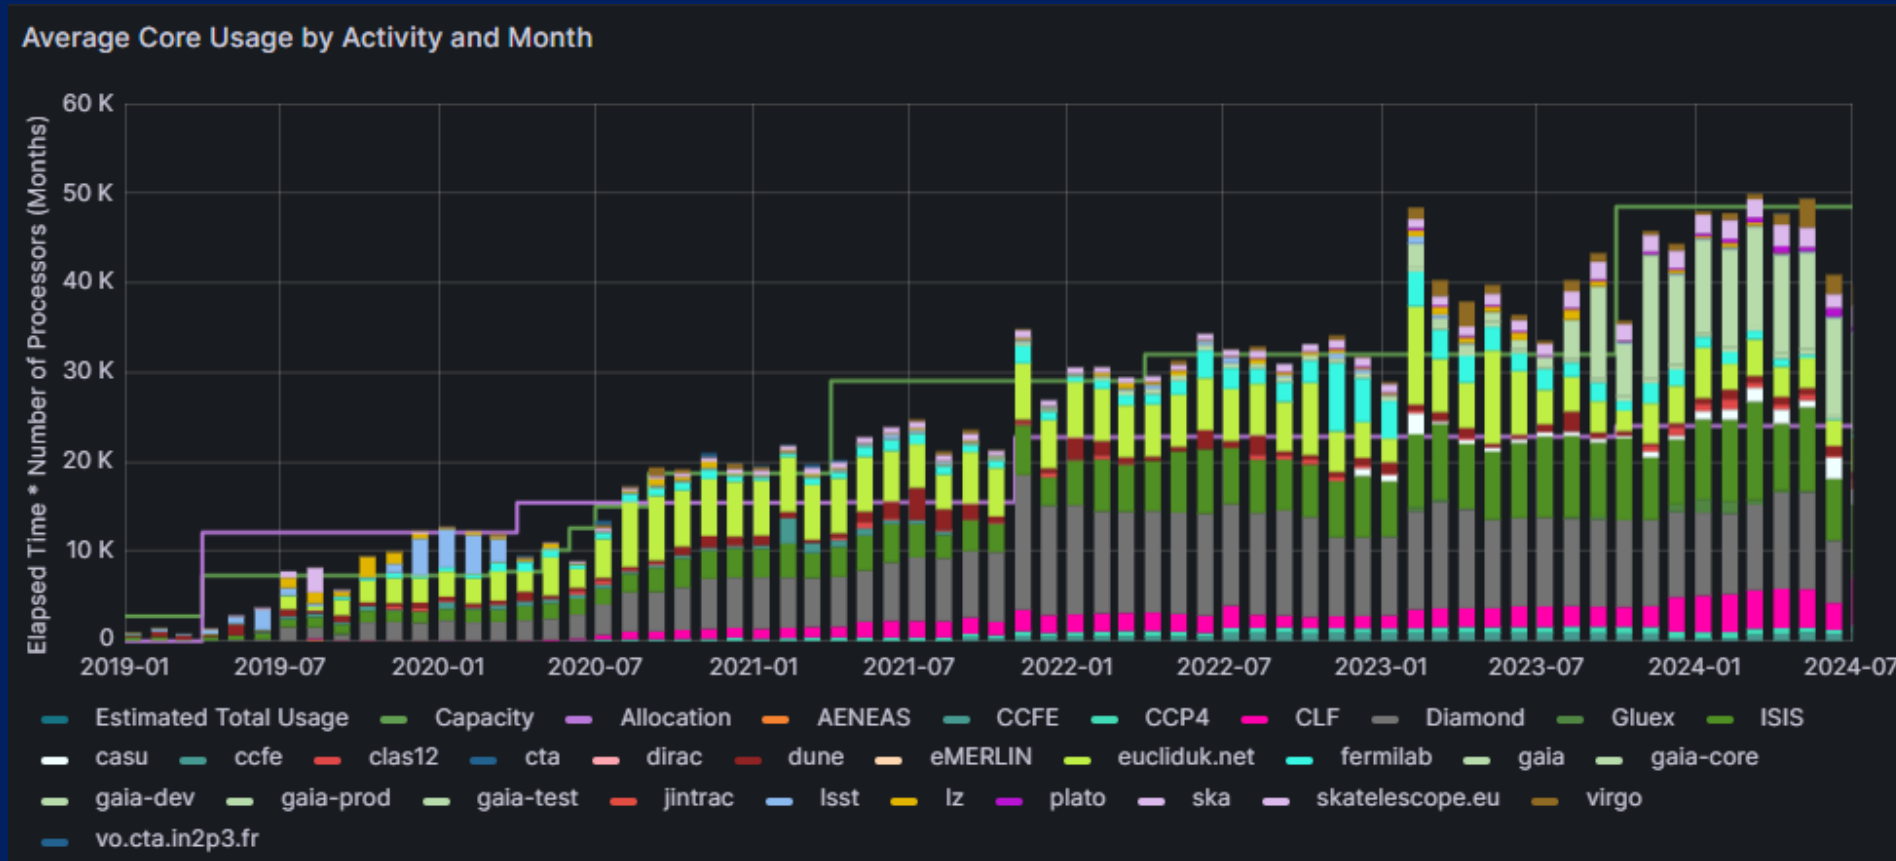

Sustainable, adj.

Capable of being maintained or continued at a certain level or rate

Sustainable, adj.

Capable of being maintained or continued at a certain level or rate

Sustainable, adj.

Capable of being maintained or continued at a certain level or rate

Could Keir Starmer's AI dream derail his own green energy promise?

ANNOUNCEMENT

Nscale invests £2 billion in the UK data centre industry

Sustainable?

Accelerating demand for compute creates challenges

Cost

Skills

Power

Water
Usage

Waste

Carbon
emissions

Accelerating demand for compute creates challenges

Rising demand for compute to achieve science goals

Diminishing improvements in raw compute power over time

Cost

More efficient use of resources

– federation, pooling, mixed-access models, heterogeneous infrastructure

Improved financial modelling and planning

Joined-up approach to funding assessment, award, and oversight

Accelerating demand for compute creates challenges

New technologies

Increasing scale of deployments

New techniques and algorithms

Skills

Larger pool of skilled people

Improved incentives and recognition

More training opportunities

Accelerating demand for compute creates challenges

More compute

More cooling

Power

Increased grid capacity

Grid improvements

Hardware improvements

Renewables

Smart scheduling

Accelerating demand for compute creates challenges

Increased cooling requirements

Water abstraction and waste

Water
Usage

Data centre improvements

Data centre siting

Tightened environmental requirements

Accelerating demand for compute creates challenges

Reuse and recycling of systems and components

Increased lifecycles

Waste

Reuse and recycling of systems and components

Increased lifecycles

Accelerating demand for compute creates challenges

More hardware

More electricity

More cooling

Carbon
emissions

Green procurement

Renewable energy

Efficient usage

Improved algorithms

Improved architectures

UKRI DRI NetZero: IRISCAST

Measuring Carbon

NetZero and the IRISCAST Project

IRIS: IRIS-CMP

Allocating Carbon Costs to Payloads

 **iris CMP**

Alex Owen (QMUL) Daohai Li (QMUL)
Jon Hays (QMUL) Alex Dibbo (STFC)

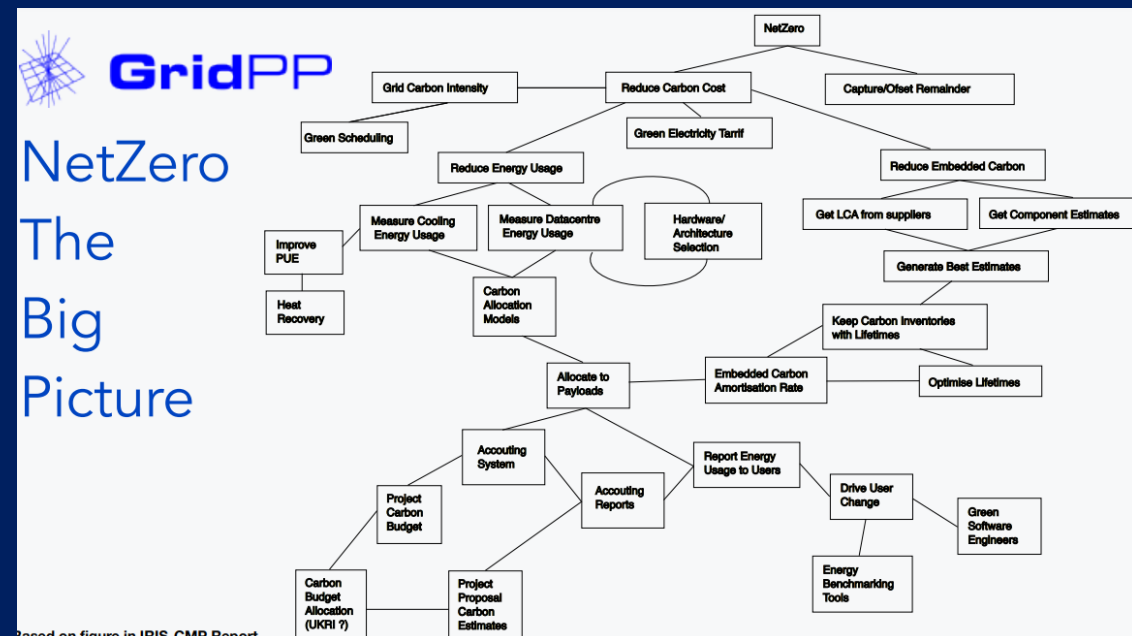

<https://doi.org/10.5281/zenodo.10966001>

Take job level measurements on live systems

Develop and evaluate two simple models of carbon accounting suitable for both grid computing and cloud infrastructures

Based on figure in IRIS-CMP Report

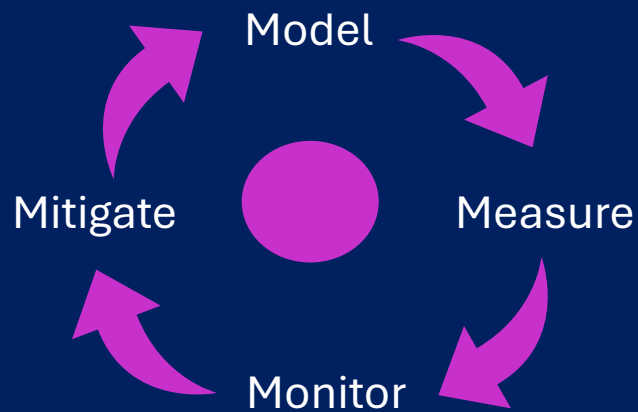

Key conclusions

Keep it simple

Gather widely – use wisely

Think like an accountant not a scientist!
