Neutrino physics in a nutshell

- Neutrinos are among the most **abundant** and **elusive** particles in the Universe
 - in the Standard Model (SM): **neutral leptons, massless, weak interactions**

- Neutrinos are unique messenger
 - astroparticle physics
 - SM validation and gateway toward its extension

Neutrino physics in a nutshell

- neutrino oscillation mechanism: first evidence of beyond the SM (BSM) physics

flavour eigenstates, $\alpha = (e, \mu, \tau)$

mass eigenstates, $i = (1, 2, 3)$

$$|\nu_\alpha\rangle = \sum_{i=1}^3 U_{\alpha i}^* |\nu_i\rangle$$

U_{PMNS} matrix

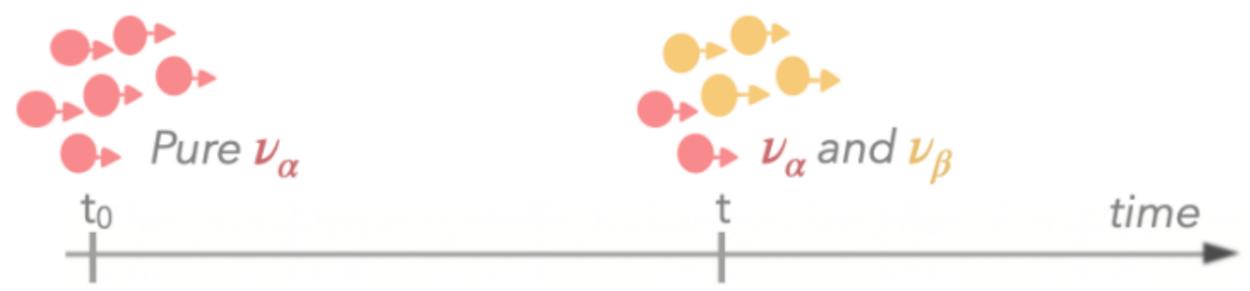

U_{PMNS} (3x3, unitary)

Atmospheric	Reactor/Accelerator	Solar	
$\begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix}$	$\begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta} & 0 & c_{13} \end{pmatrix}$	$\begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$	$\begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$

* $s_{ij} = \sin\theta_{ij}$, $c_{ij} = \cos\theta_{ij}$

Oscillation probability: $P(\nu_\alpha \rightarrow \nu_\beta) \simeq \sin^2(2\theta) \sin^2\left(\frac{\Delta m^2 L}{4E}\right)$

$\theta = \text{mixing angle}$, $\Delta m^2 = m_1^2 - m_2^2$,
 $L = \text{baseline}$, $E = \text{energy}$

Open questions in neutrino oscillation

- is ν_3 mostly ν_μ or ν_τ ? θ_{23} octant
- which neutrino is the lightest? **Neutrino Mass Ordering**
- is the charge-parity (CP) violated in the leptonic sector? δ_{CP} phase

5% precision on $\sin\theta_{23}$
if $\theta_{23}=45^\circ, |U_{\mu 3}| = |U_{\tau 3}|$

Taken from NuFit 6.0

parameter	measurement	uncertainty
Δm_{21}^2	$(7.49 \pm 0.19) \times 10^{-5} \text{ eV}^2$	3 %
$ \Delta m_{31}^2 $	$(2.52 \pm 0.03) \times 10^{-3} \text{ eV}^2$	1 %
$\sin^2 \theta_{12}$	$(0.307^{+0.012}_{-0.011})$	4 %
$\sin^2 \theta_{13}$	$(0.02195^{+0.00054}_{-0.00058})$	3 %
$\sin^2 \theta_{23}$	$(0.561^{+0.012}_{-0.015})$	5 %
$\text{sign } \Delta m_{31}^2$	unknown	
δ_{CP}	unknown	

Normal Ordering Inverted Ordering

(mass)²

Δm_{32}^2 Δm_{21}^2

Δm_{21}^2 Δm_{31}^2

we know that:

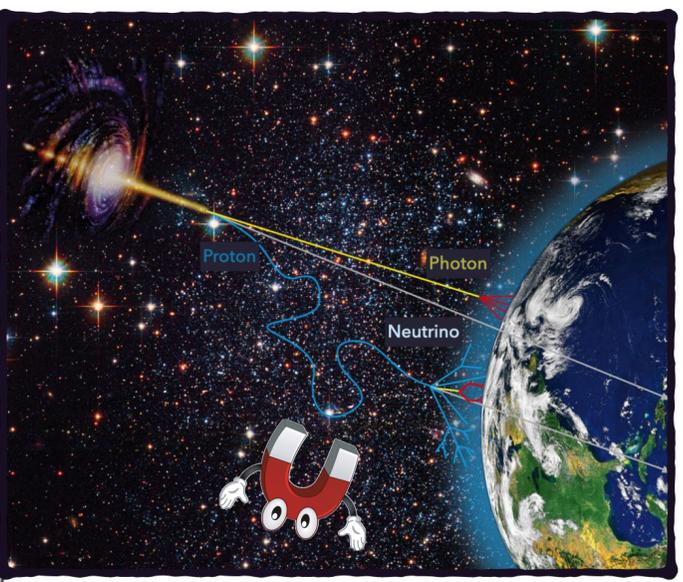

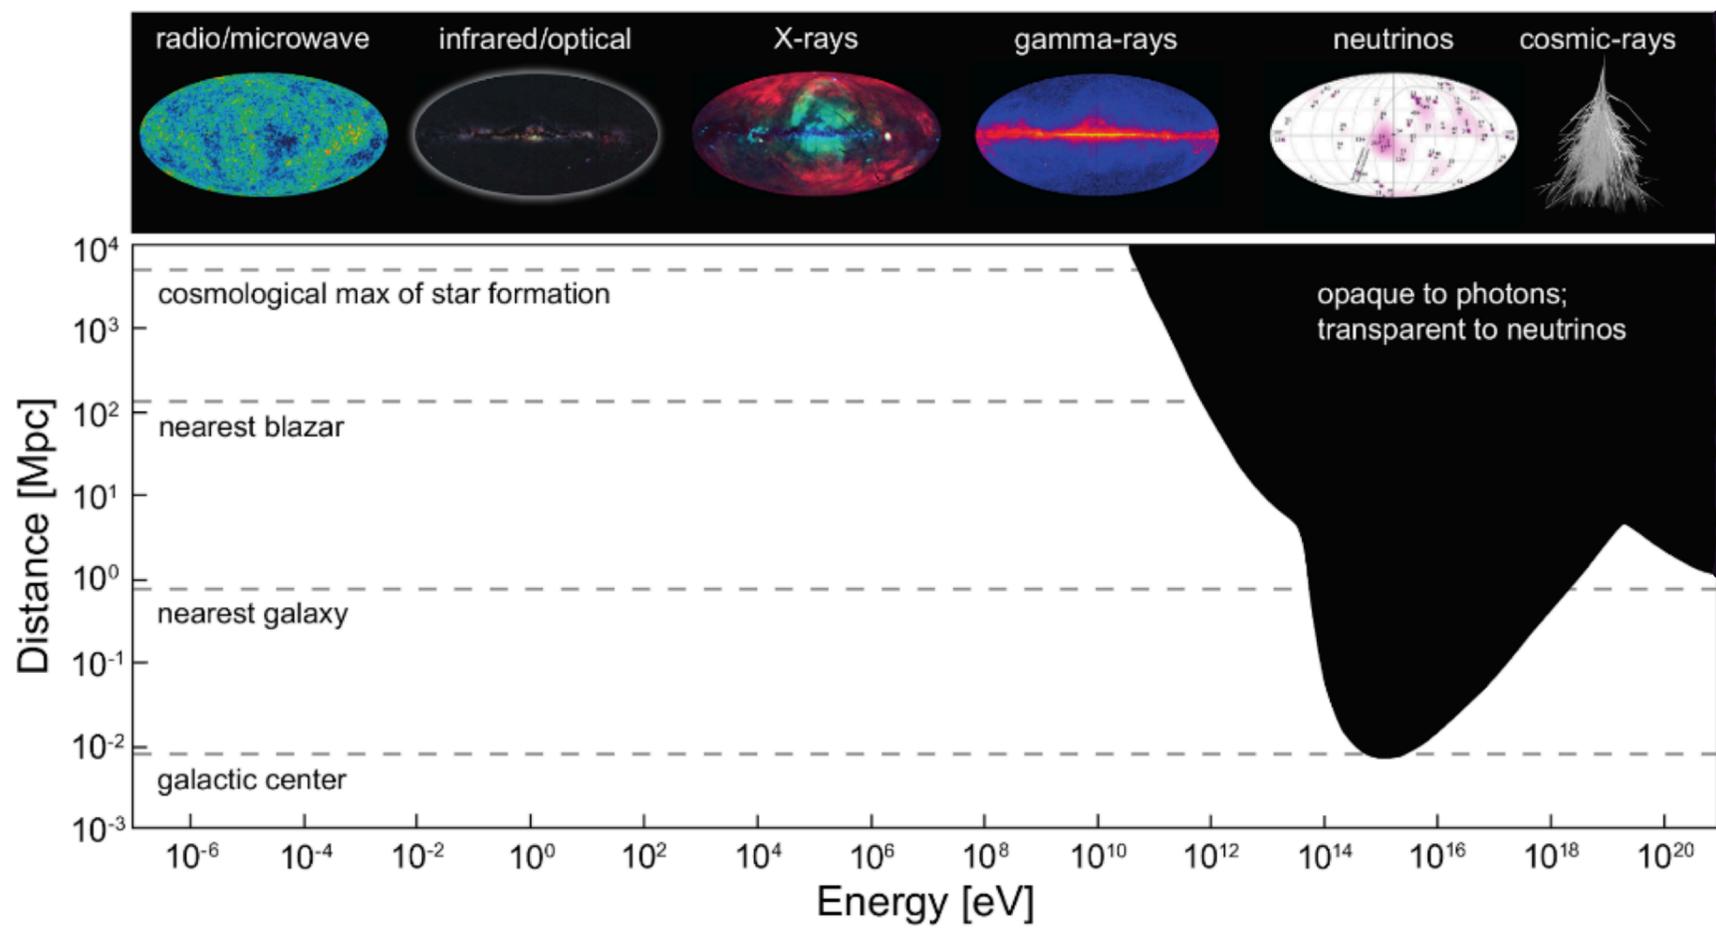

- $m_1^2 < m_2^2$
- $m_2^2 - m_1^2 \ll |m_3^2 - m_{1,2}^2|$

what about $\text{sign } \Delta m_{31}^2$?

Do neutrinos and anti-neutrinos oscillate differently?

Multi-messenger astronomy with neutrino telescopes

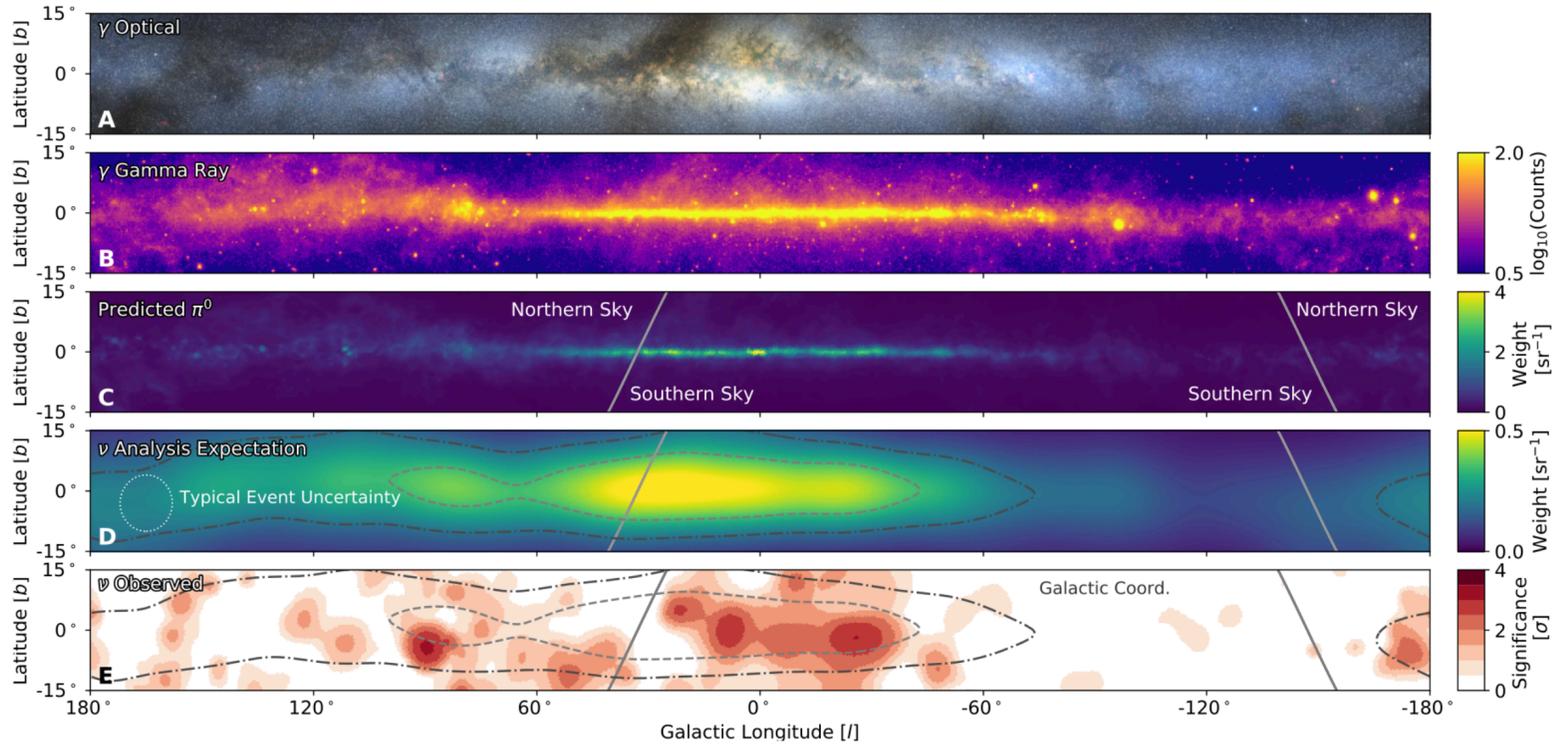

- Due to weak interactions, **neutrinos travel undisturbed** over huge distances

- **protons'** direction is deviated by galactic magnetic fields
- **photons** can be absorbed

IceCube Coll., Science, 380 (2023) 1338

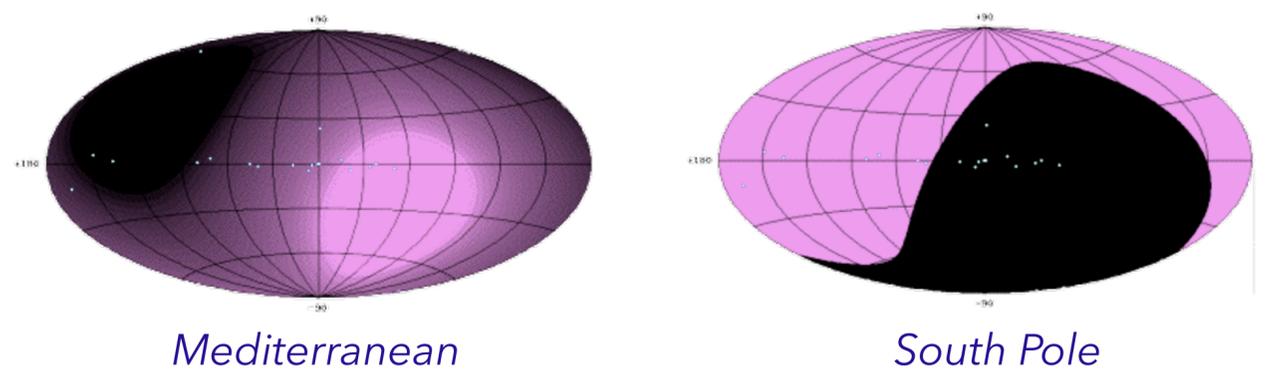

- **Pointing** to the source
- Reveal the **production mechanism** (e.g. Sun, SuperNovae, other astronomical sources as Active Galactic Nuclei, black holes, etc...)

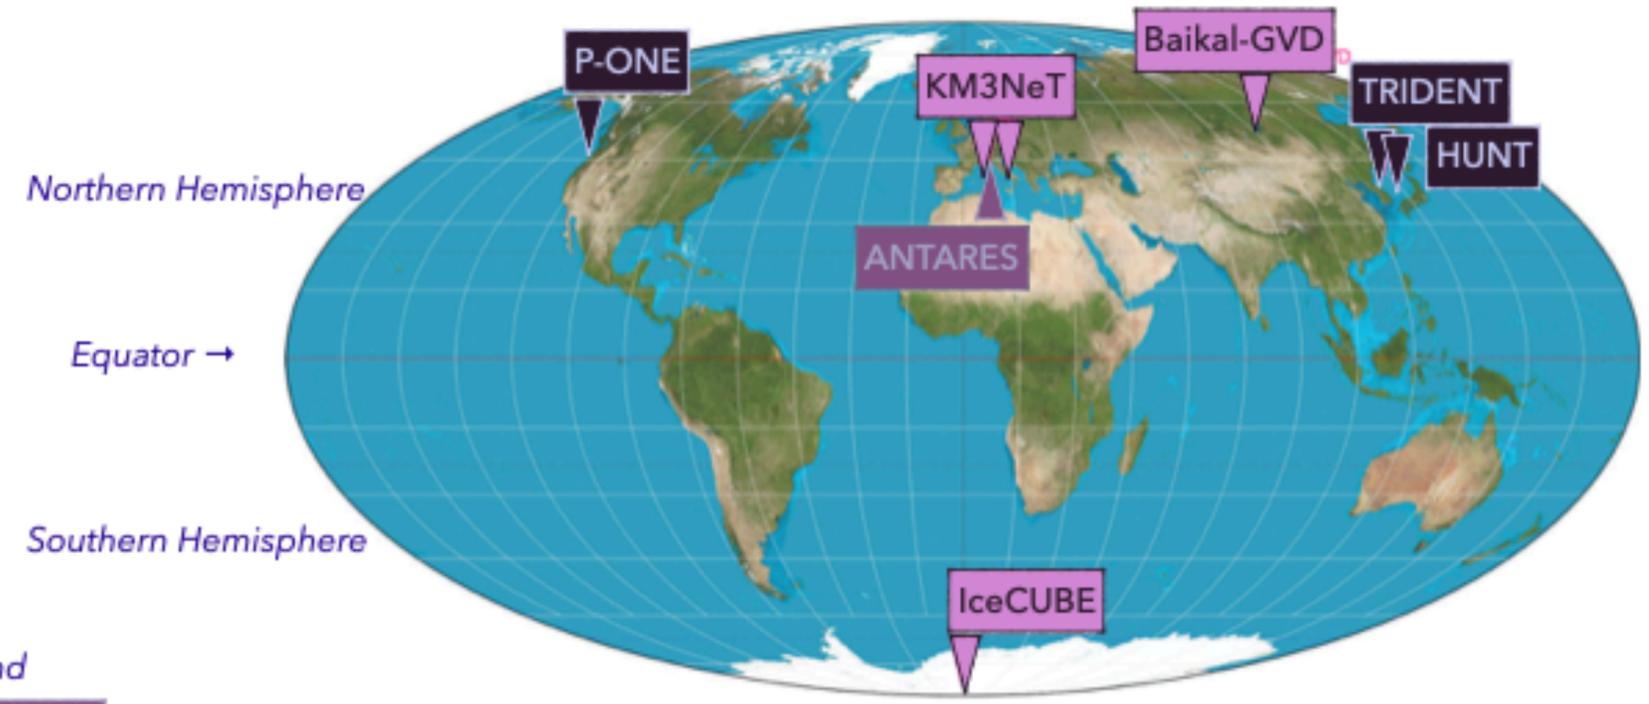

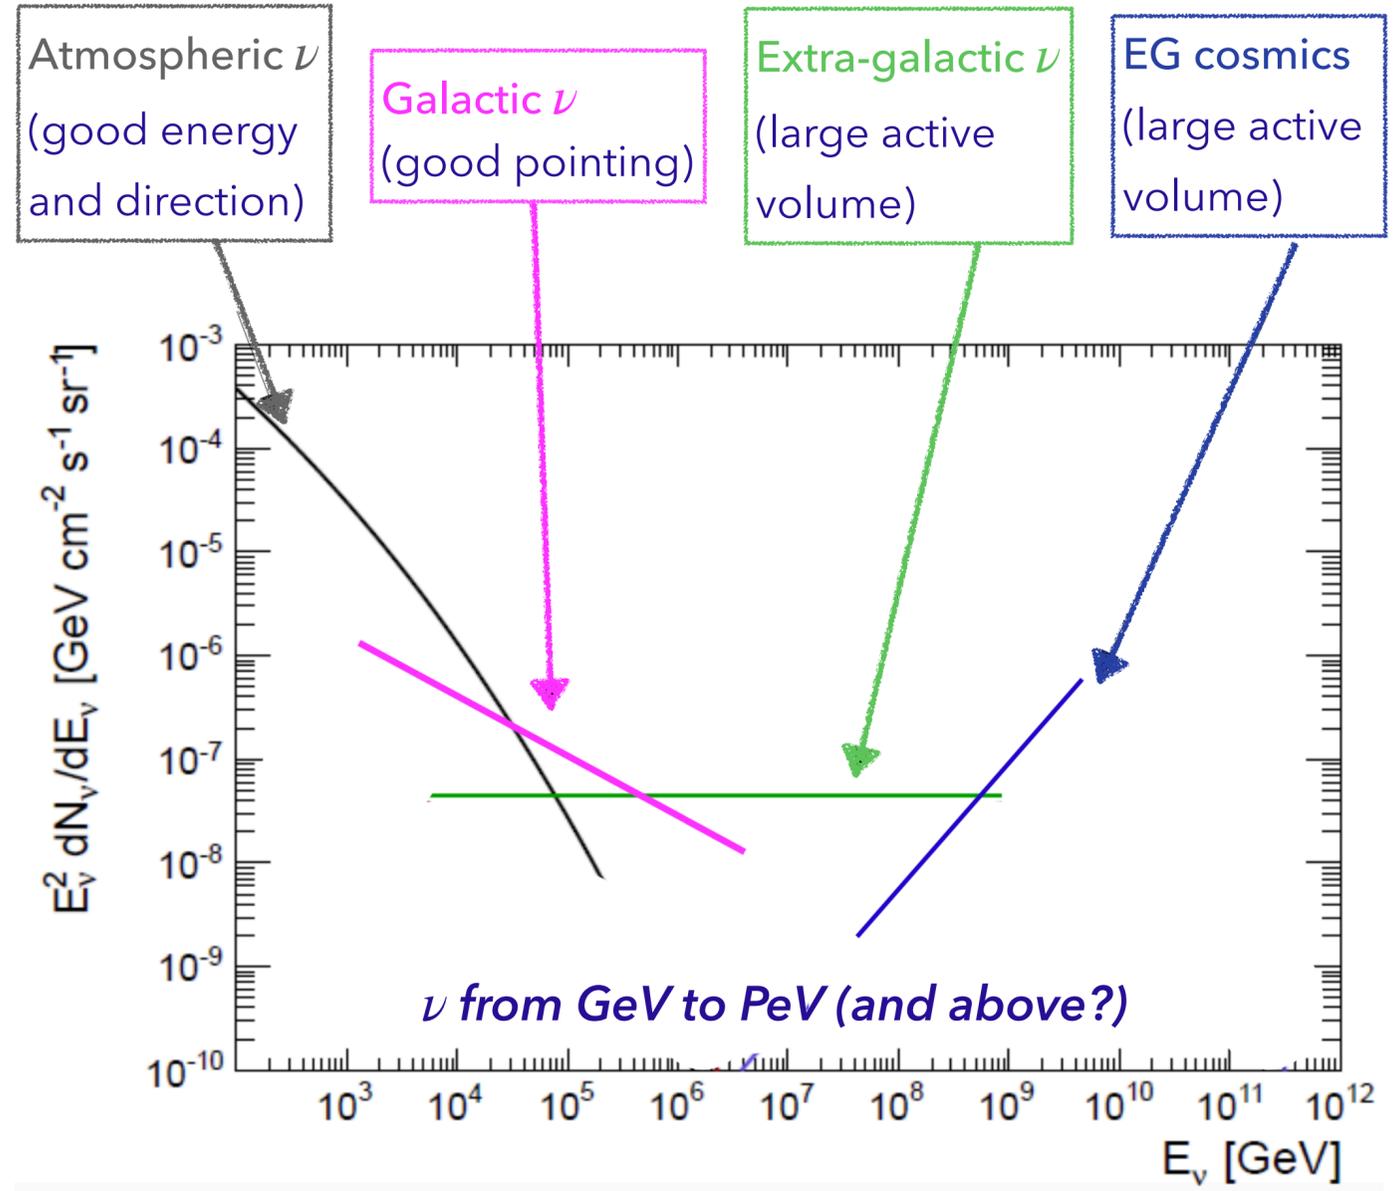

Neutrino telescopes overview

- Strong complementarity
 - **location**: accessible visible sky
 - **technology**: diverse neutrino astronomy targets

The KM3NeT experiment

- **Water Cherenkov neutrino telescope** under construction in the **deep Mediterranean Sea**
- two detection sites for a **complementary physics program**

Neutrino oscillations in ORCA

📍 *offshore Toulon (France)*

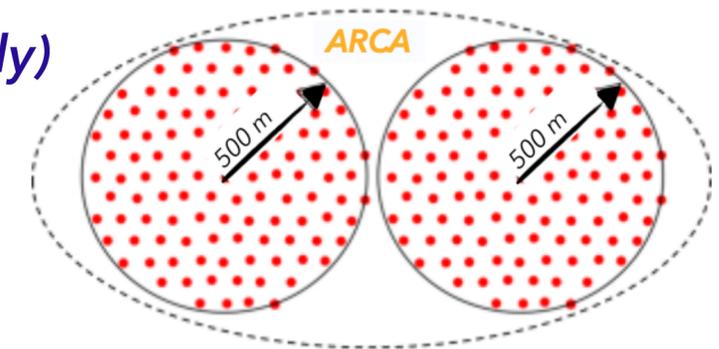

- depth: 2450 m
- Detection Units (DUs): 115
- instrumented vol. ~ 28%

Neutrino astronomy in ARCA

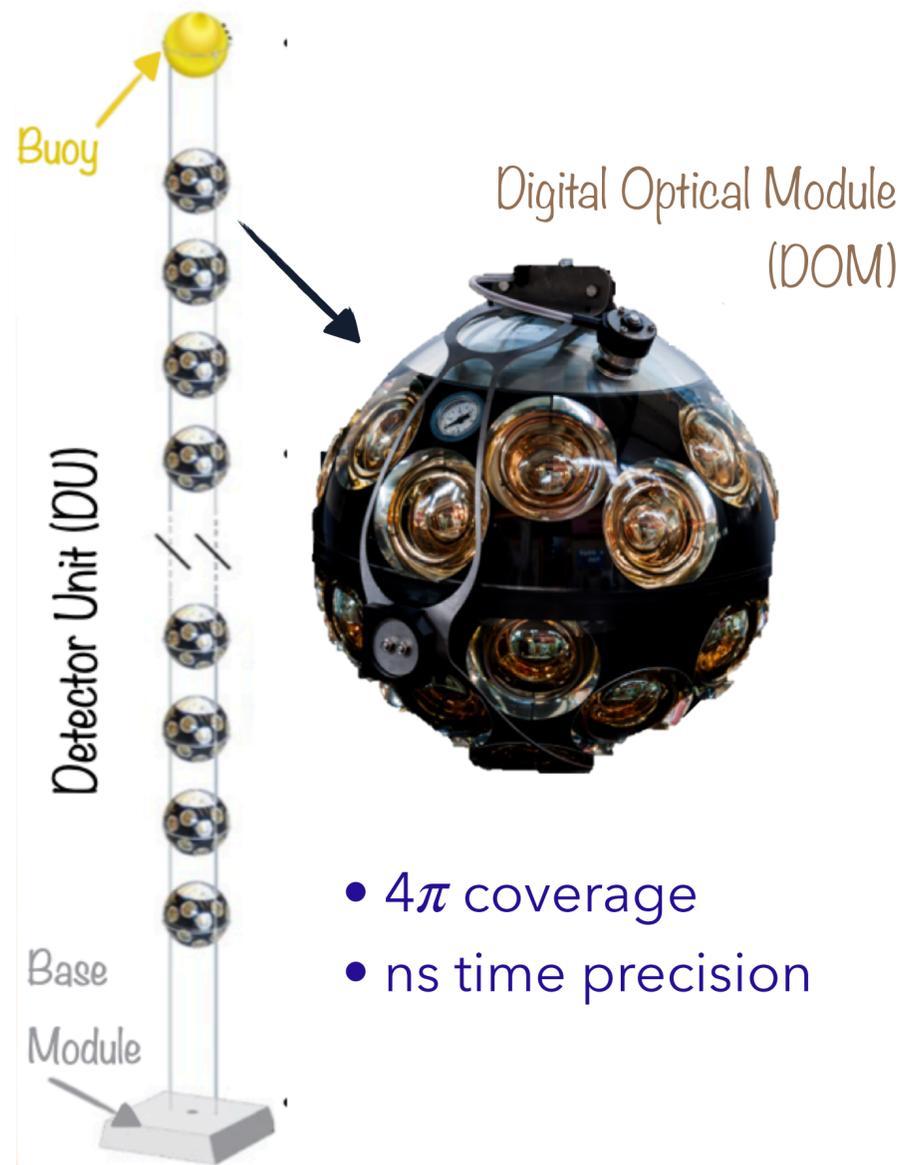

📍 *offshore CapoPassero (Italy)*

- depth: 3560 m
- DUs: 230
- instrumented vol. ~ 22%

The KM3NeT experiment

- same **modular structure** to detect Cherenkov radiation of secondary particle from ν interactions
 - 31 three-inches PMTs in each DOM, 18 DOM in each DU
 - accessible energy depending on interDOM/interDU distance

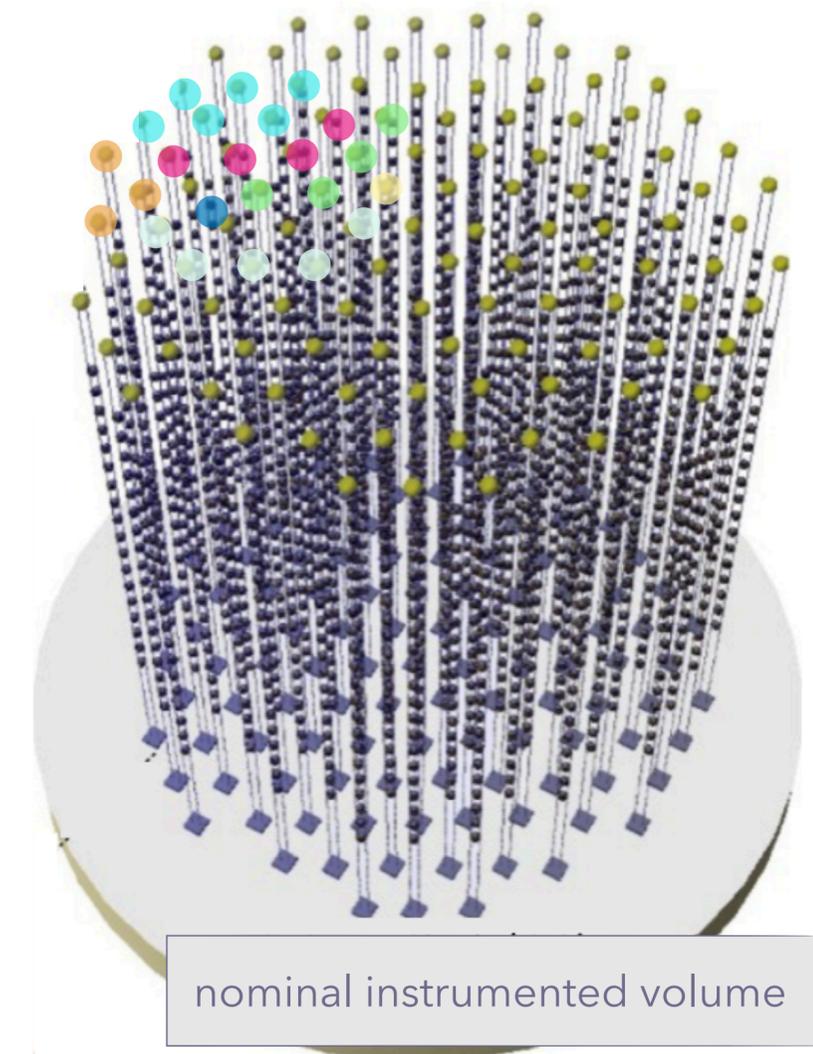

ADVANTAGES

- well-known detection principle
- perform **physics studies from the installation phase**

CHALLENGES

- **several detector configurations**
- data taking optimization

KM3NeT/ORCA: detector installation

DU preparation
on the Castor boat

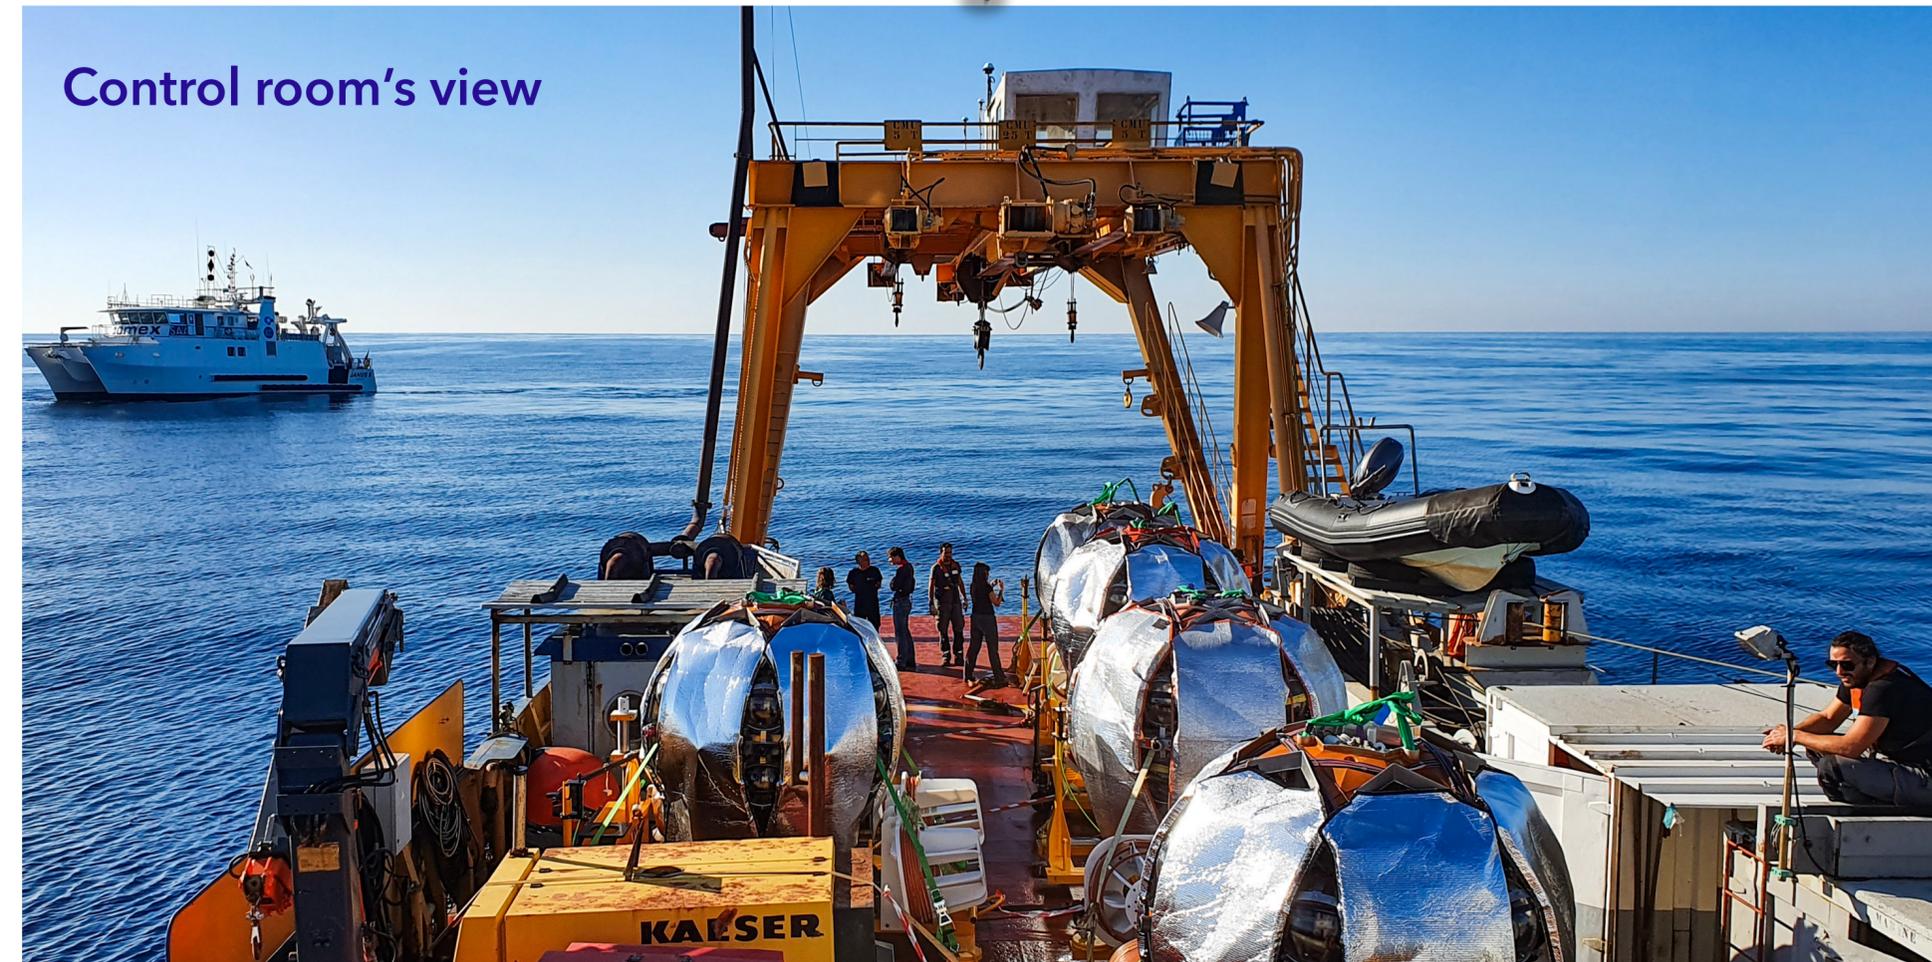

- DU assembly in several labs in Europe (LPC Caen, Nantes, Strasburg, Nikhef)
- DU integration and pre-installation calibration in Marseille (CPPM)

- **data-driven Monte Carlo optimisation** (trigger rate, PMT mean and RMS rates, etc..)
- data-quality monitoring (1-3h delay after run acquisition)

example of data quality monitoring

Monte Carlo (MC) simulations

- signal: **atmospheric and cosmic neutrinos** in the GeV-TeV energy scale
(all flavours, charge-current (CC) and neutral-current (NC) interactions)
- backgrounds:
 - **atmospheric muons**
 - **optical noise** (^{40}K decay, PMT dark counts, bioluminescence)

event generation

- cosmic muons (MUPAGE)
- neutrinos (gSeaGen), HONDA flux and others

light propagation

- full tracking and look-up tables
- absorption/scattering length
- PMT QE

trigger

- PMT electronic response
- data-driven optical bkg

reconstruction

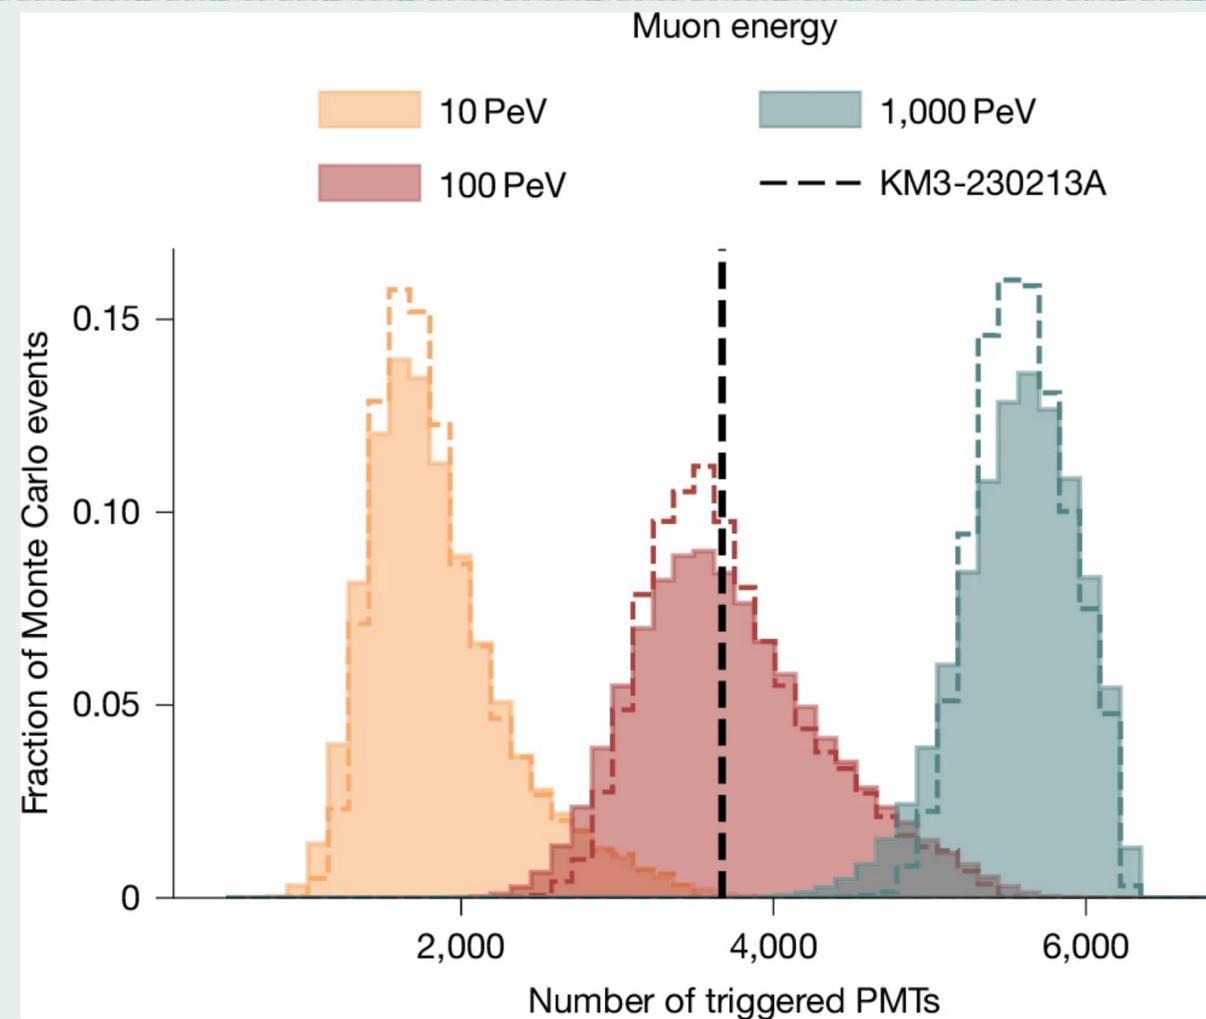

- maximum likelihood algorithms
- track-like and shower-like event hypothesis

The KM3-230213A: direction and energy reconstruction

- an horizontal muon (*..too horizontal to be cosmic muons!*)
- muon energy reconstructed from collected amount of light
- neutrino energy estimation assuming a E^{-2} source spectrum

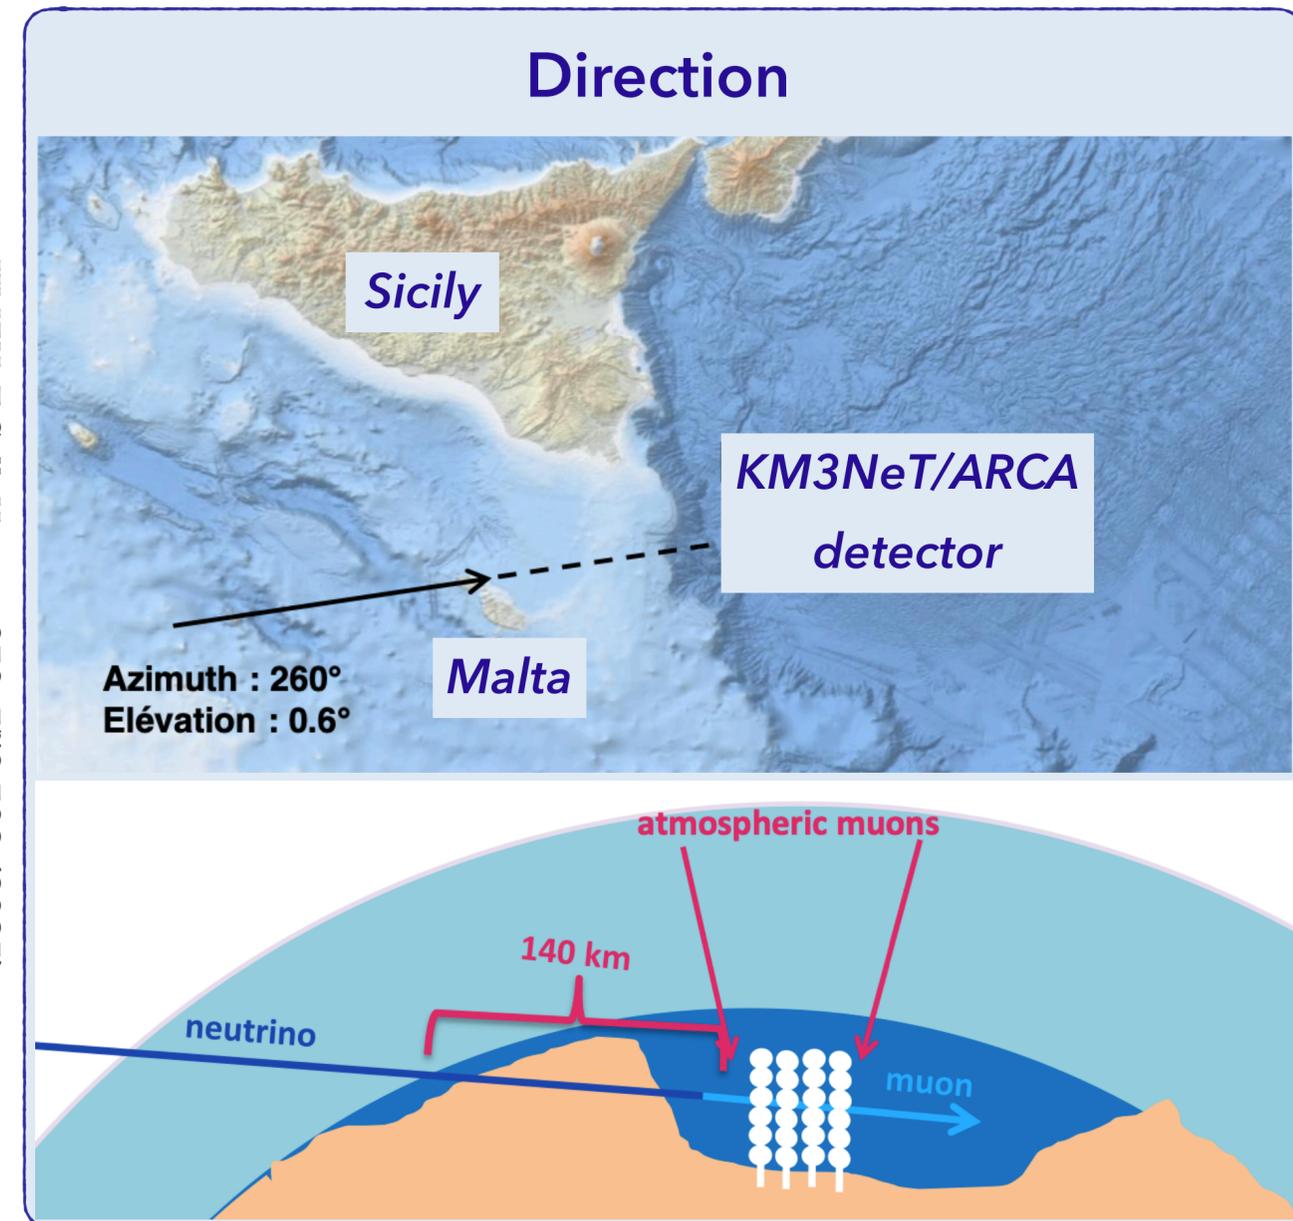

Energy

- $E_{\mu} = 120^{+110}_{-60}$ PeV
- $E_{\nu} = 220^{+570}_{-100}$ PeV

Direction

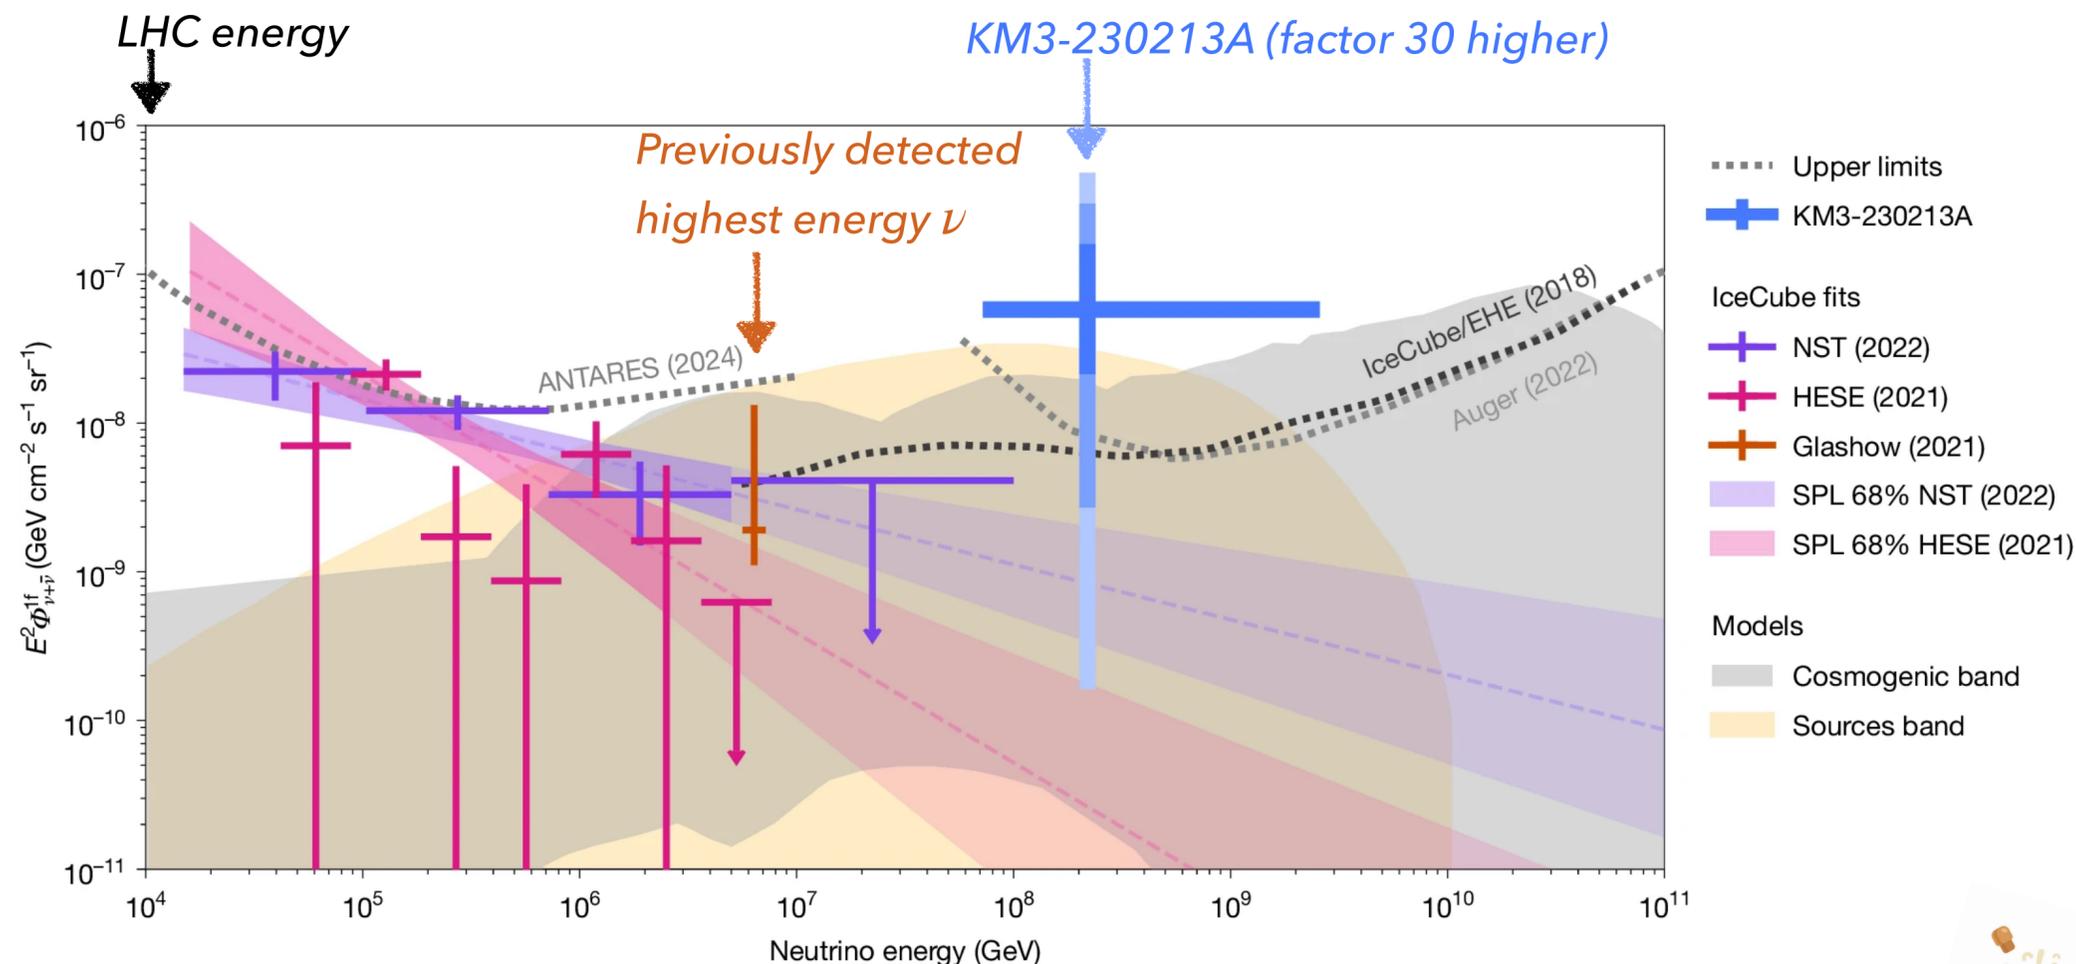

KM3NeT Coll, Nature 638, 576-582 (2025)

The KM3-230213A: interpretation

- the Very High Energetic neutrino event (hypotheses to be confirmed)

- produced in cosmic higher-energy accelerator such as Active Galactic Nuclei, associated with massive black hole
- cosmogenic neutrino (if so, it would be the first ever detected)

no firm conclusion can be drawn from a single event detection

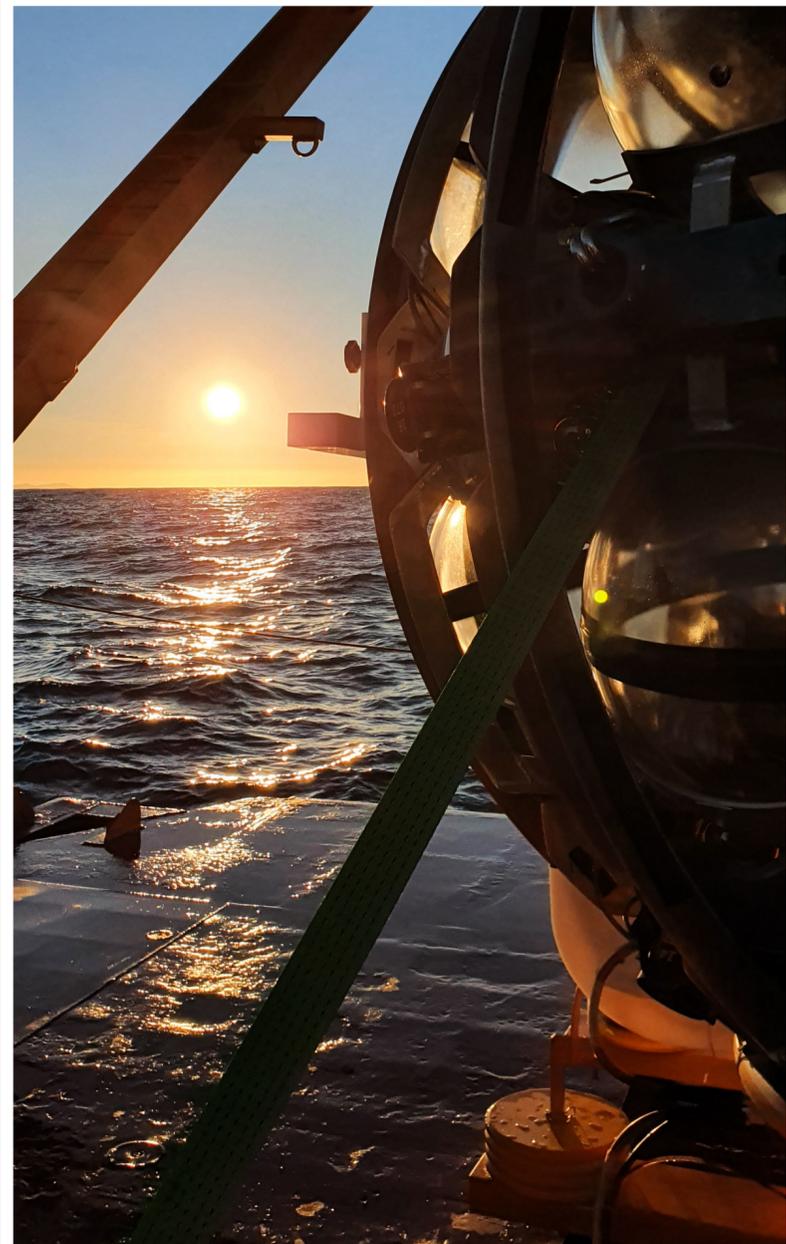

Article Observation of an ultra-high-energy cosmic neutrino with KM3NeT

The detection of cosmic neutrinos with energies above a teraelectronvolt (TeV) offers a unique exploration into astrophysical phenomena^{1–3}. Electrically neutral and interacting only by means of the weak interaction, neutrinos are not deflected by magnetic fields and are rarely absorbed by interstellar matter; their direction indicates that their cosmic origin might be from the farthest reaches of the Universe. High-energy neutrinos can be produced when ultra-relativistic cosmic-ray protons or nuclei interact with other matter or photons, and their observation could be a signature of these processes. Here we report an exceptionally high-energy event observed by KM3NeT, the deep-sea neutrino telescope in the Mediterranean Sea⁴, which we associate with a cosmic neutrino detection. We detect a muon with an estimated energy of 120^{+50}_{-30} petaelectronvolts (PeV). In light of its enormous energy and near-horizontal direction, the muon most probably originated from the interaction of a neutrino of even higher energy in the vicinity of the detector. The cosmic neutrino energy spectrum measured up to now^{5–7} falls steeply with energy. However, the energy of this event is much larger than that of any neutrino detected so far. This suggests that the neutrino may have originated in a different cosmic accelerator than the lower-energy neutrinos, or this may be the first detection of a cosmogenic neutrino⁸, resulting from the interactions of ultra-high-energy cosmic rays with background photons in the Universe.

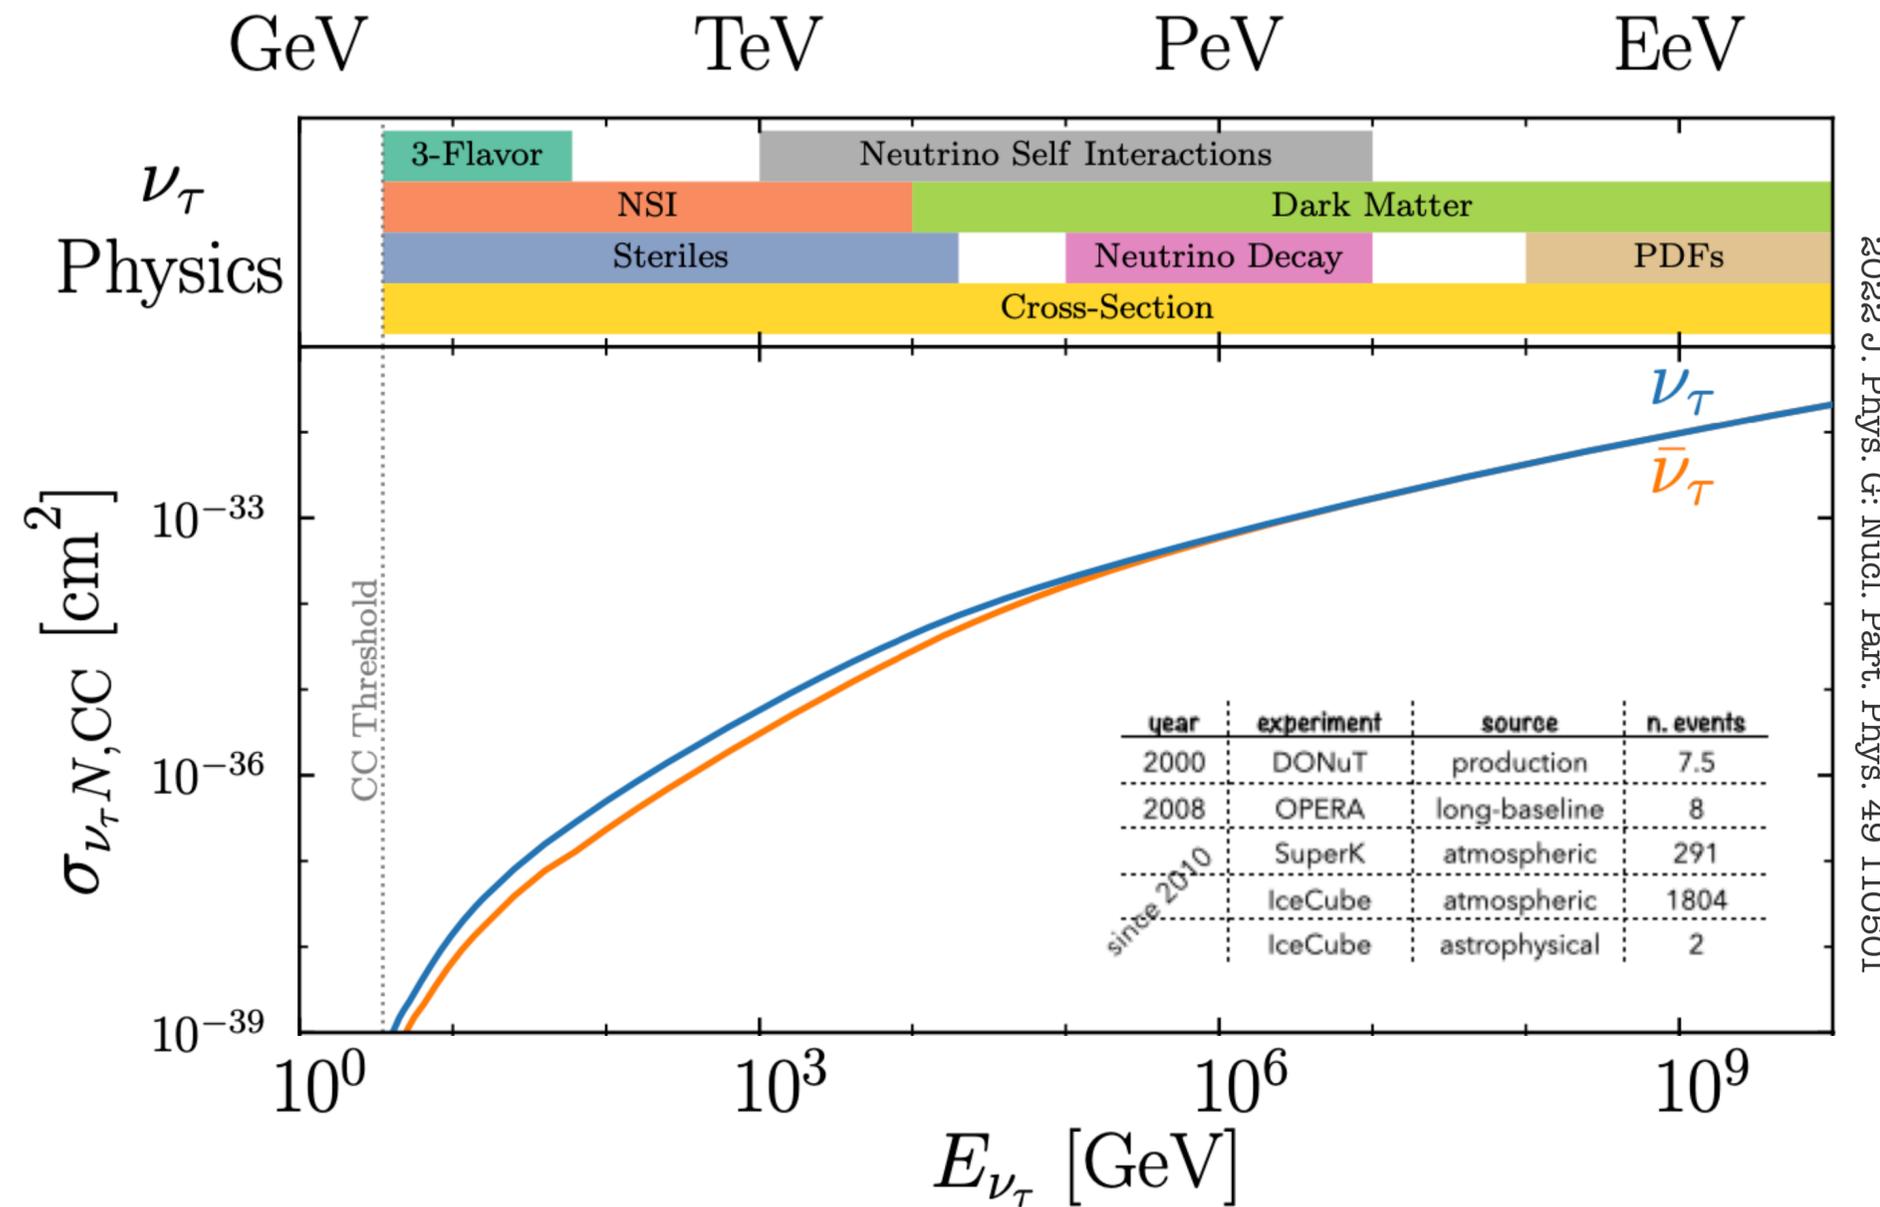

- **The role of neutrinos in astrophysics and particle physics**
 - neutrino telescopes in multi-messenger astronomy
 - open questions in neutrino oscillation physics
- **The KM3NeT experiment**
 - detection principle and technology
 - from installation to physics data
- **First study of tau neutrinos in KM3NeT/ORCA data**
 - selection of the ν sample
 - ν_τ appearance analysis
 - neutrino mixing non-unitarity test
- **Summary and prospects**

Why studying ν_τ ?

- still one of the less studied Standard Model (SM) particles (~2100 detected, so far)
 - relatively high production threshold
 - low cross-section

Why studying ν_τ ?

- next-generation neutrino experiments aims at reaching sub-percent precision in oscillation parameters

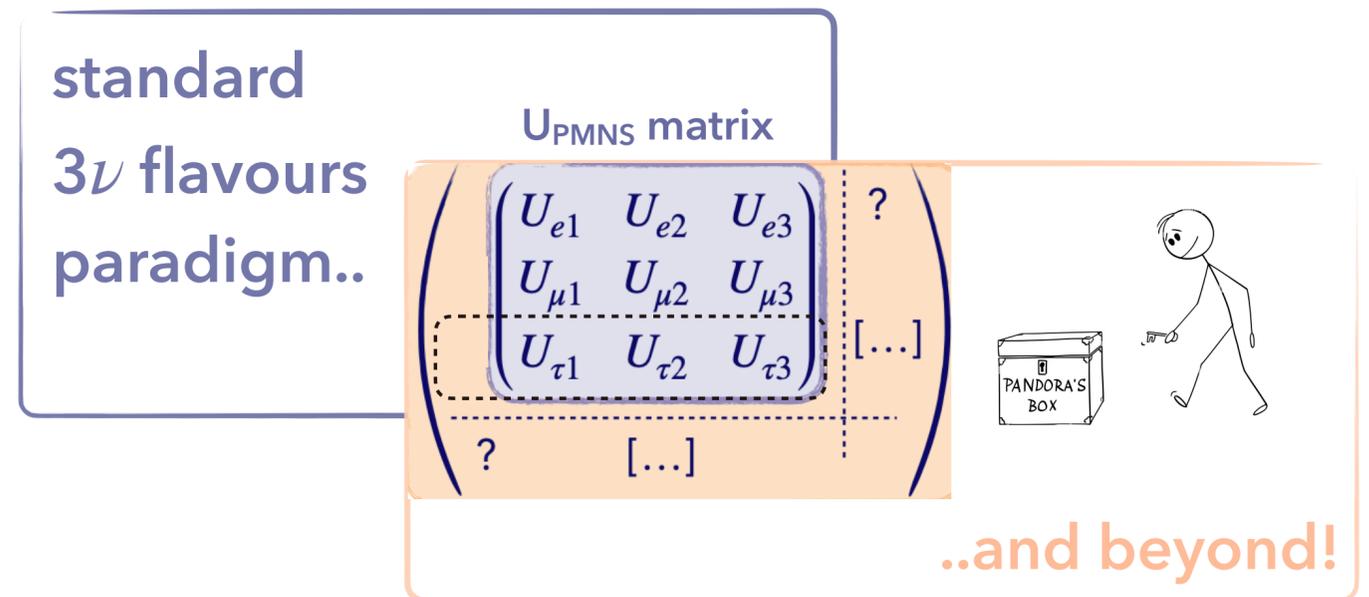

- **constraints on PMNS elements**

($< 1\%$ in e-row, but $\sim 10\%$ in τ -row)

- **neutrino mixing non-unitarity** extensions to explore

Beyond Standard Model (BSM) physics

Exploiting complementarity: different energy scale and sensitivity to oscillation parameters

- **long-baseline accelerator neutrino experiments** (e.g. OPERA, DUNE, HyperK)

- remarkable event reconstruction

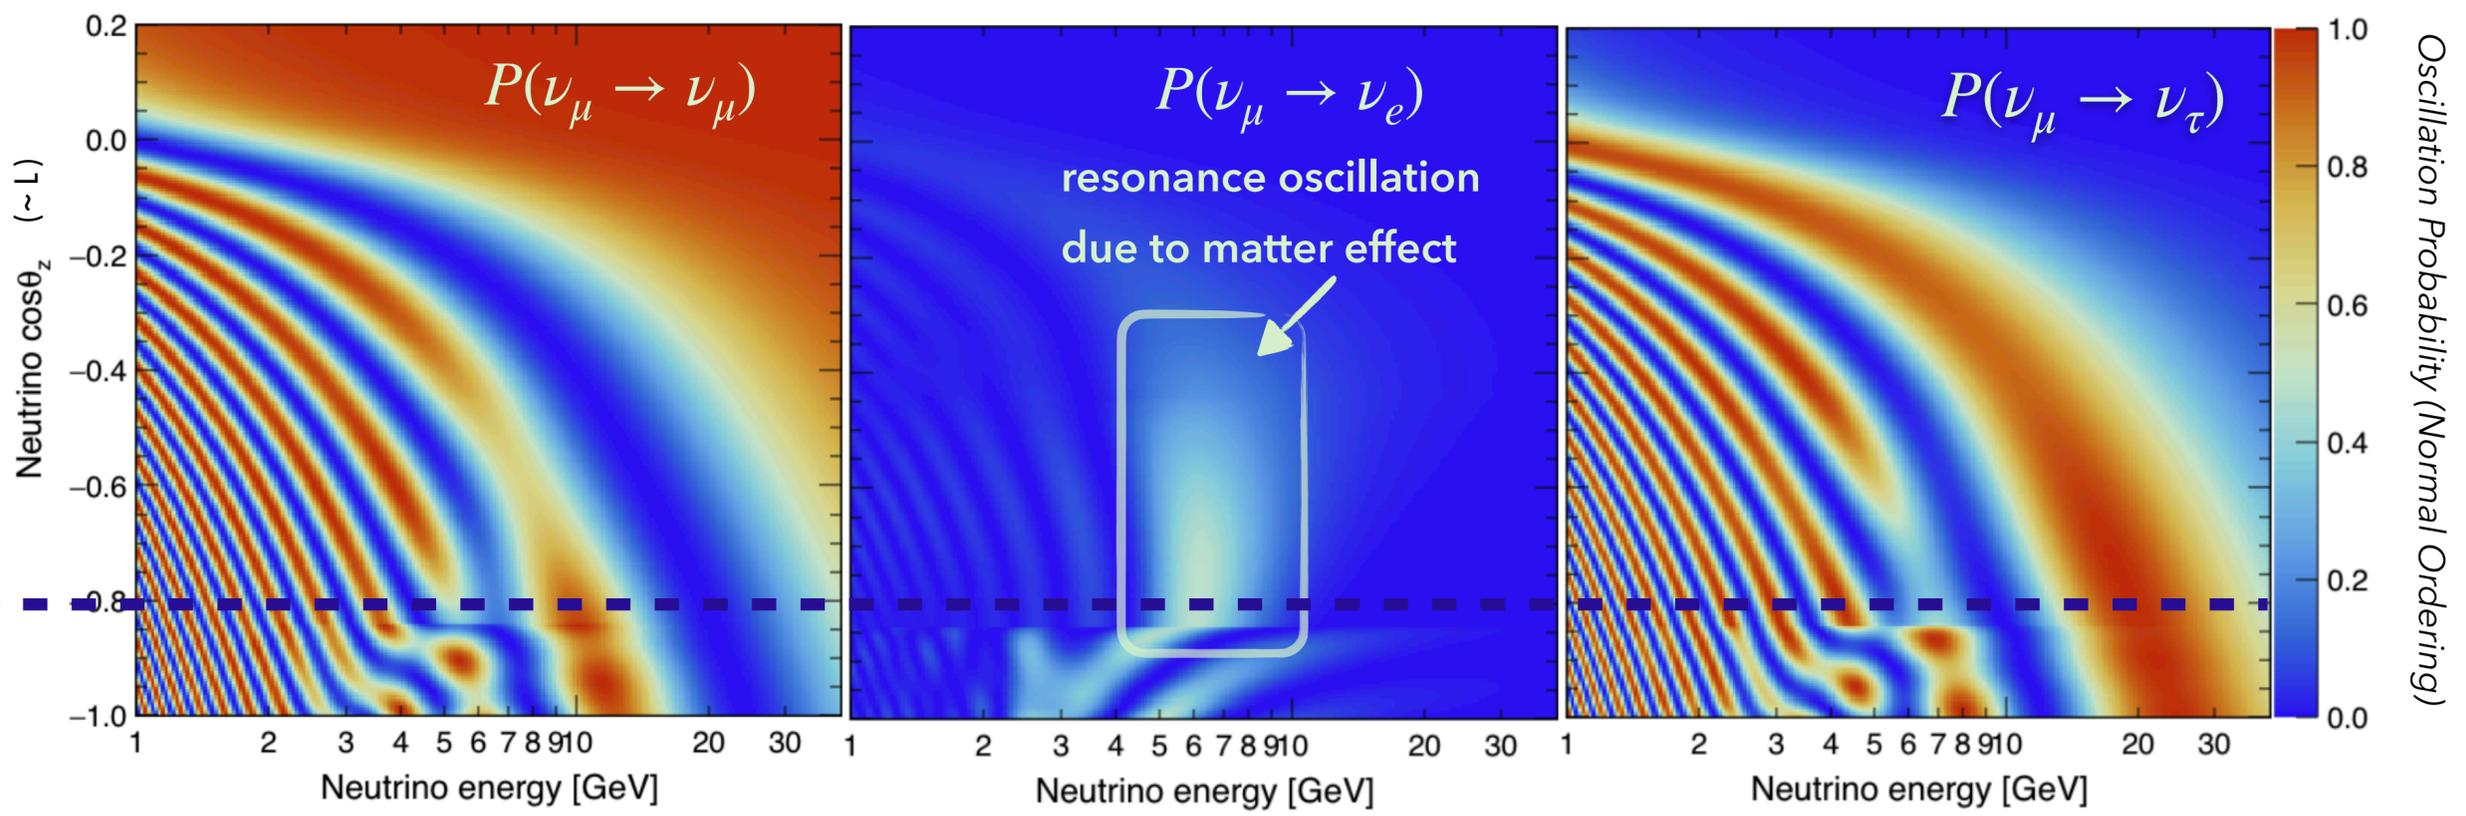

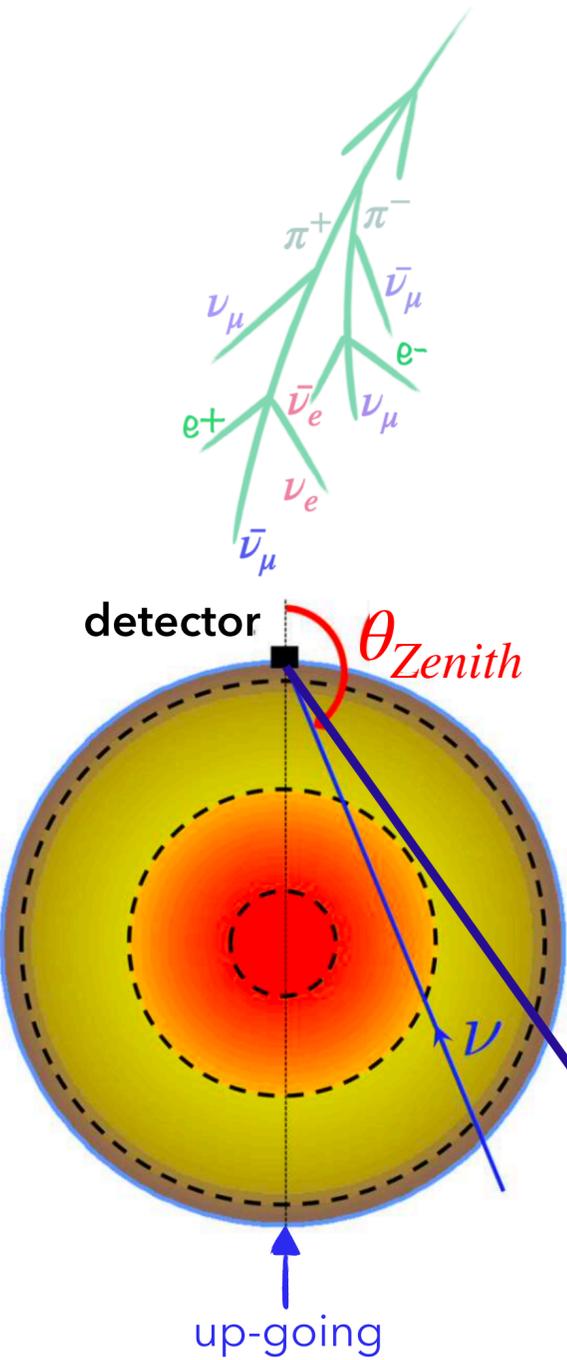

- **atmospheric neutrino experiments** (e.g. SuperK, IceCube, KM3NeT/ORCA)

- larger statistics (e.g. $\sim 3000 \nu_\tau$ / year, in KM3NeT/ORCA)

KM3NeT/ORCA physics goals

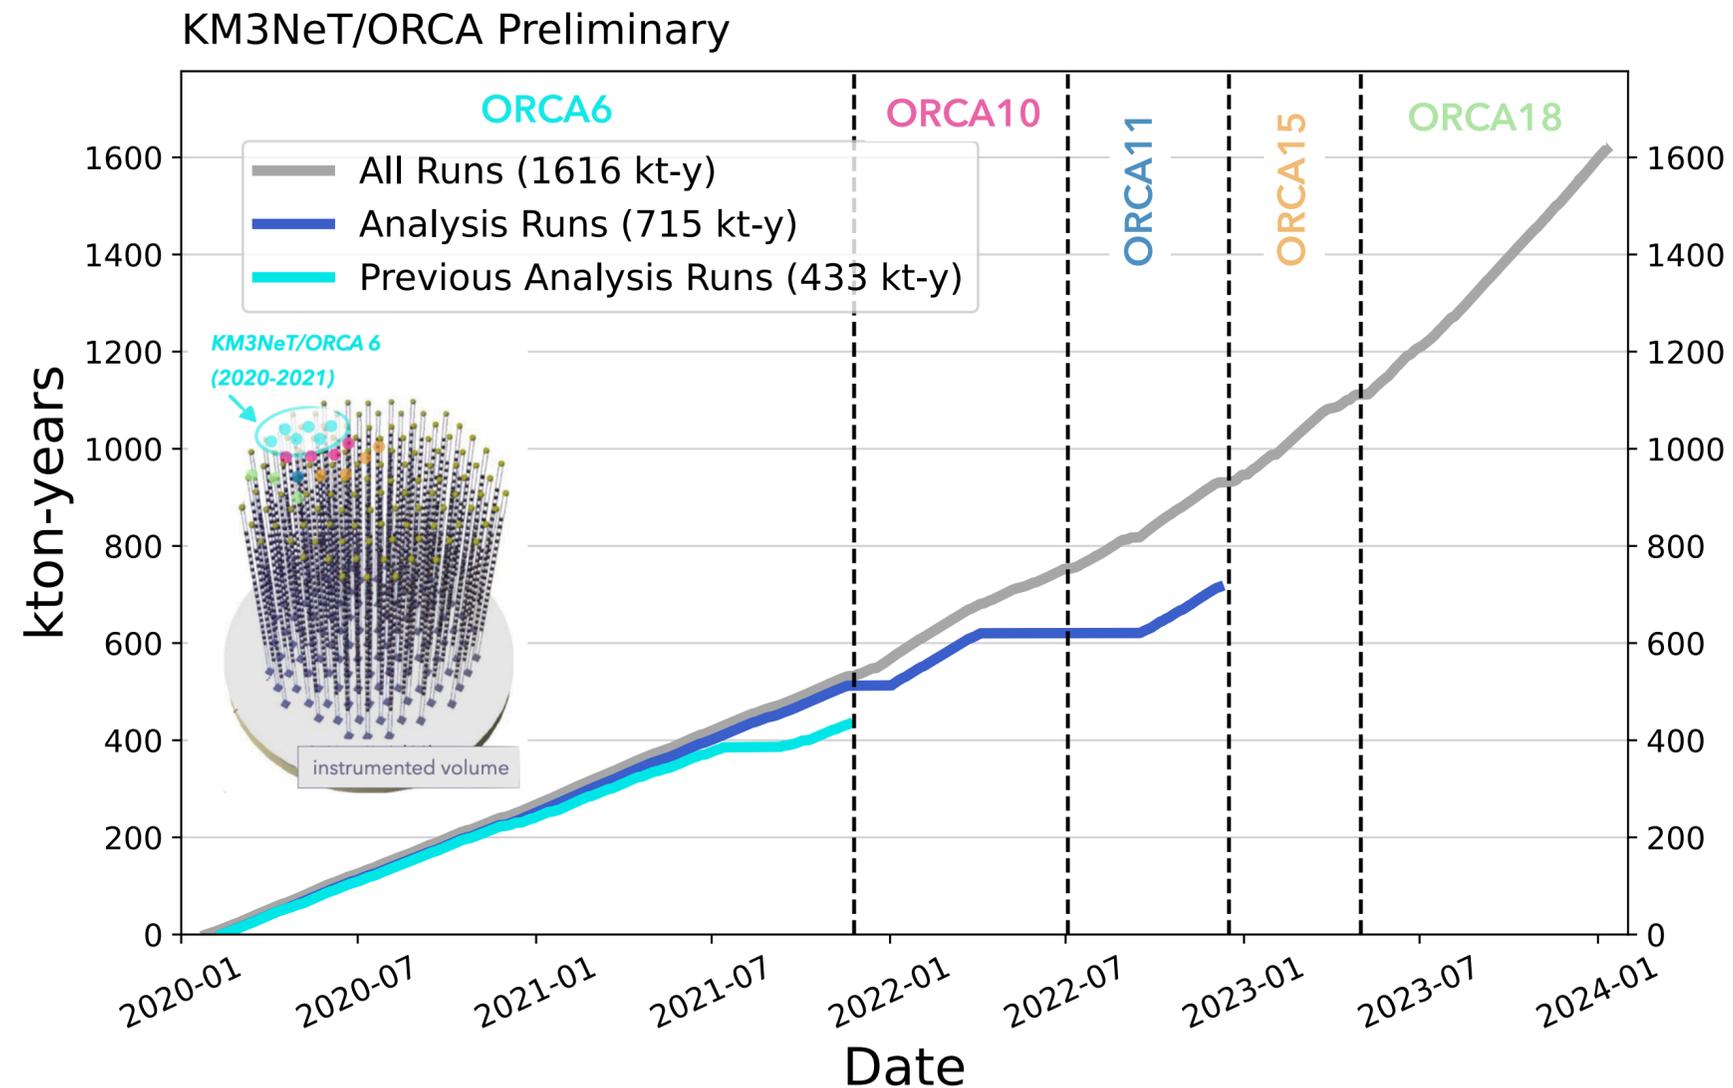

- **atmospheric neutrinos:** secondary particle from cosmic ray interaction with Earth's atmosphere

- ν_μ **disappearance (dominant effect):** neutrino oscillation parameters $\theta_{23}, \Delta m_{32}^2$
- ν_e **appearance (sub-dominant effect):** sensitive to the **Neutrino Mass Ordering (NMO)**
- other searches: ν_τ **appearance** , **sterile** and other **BSM searches**, etc...

First look at KM3NeT/ORCA 6 data

- **Six operational lines (ORCA6)** and **433 ton-years exposure** (510 days): many exploited novelties
 - reconstruction of **both tracks & showers** (first time!)
 - **opening to new oscillation analyses** by exploiting the shower topology
 - event selection using **machine learning** algorithms (e.g. Boosted Decision Trees - BDT, Random Grid Searches - RGS)

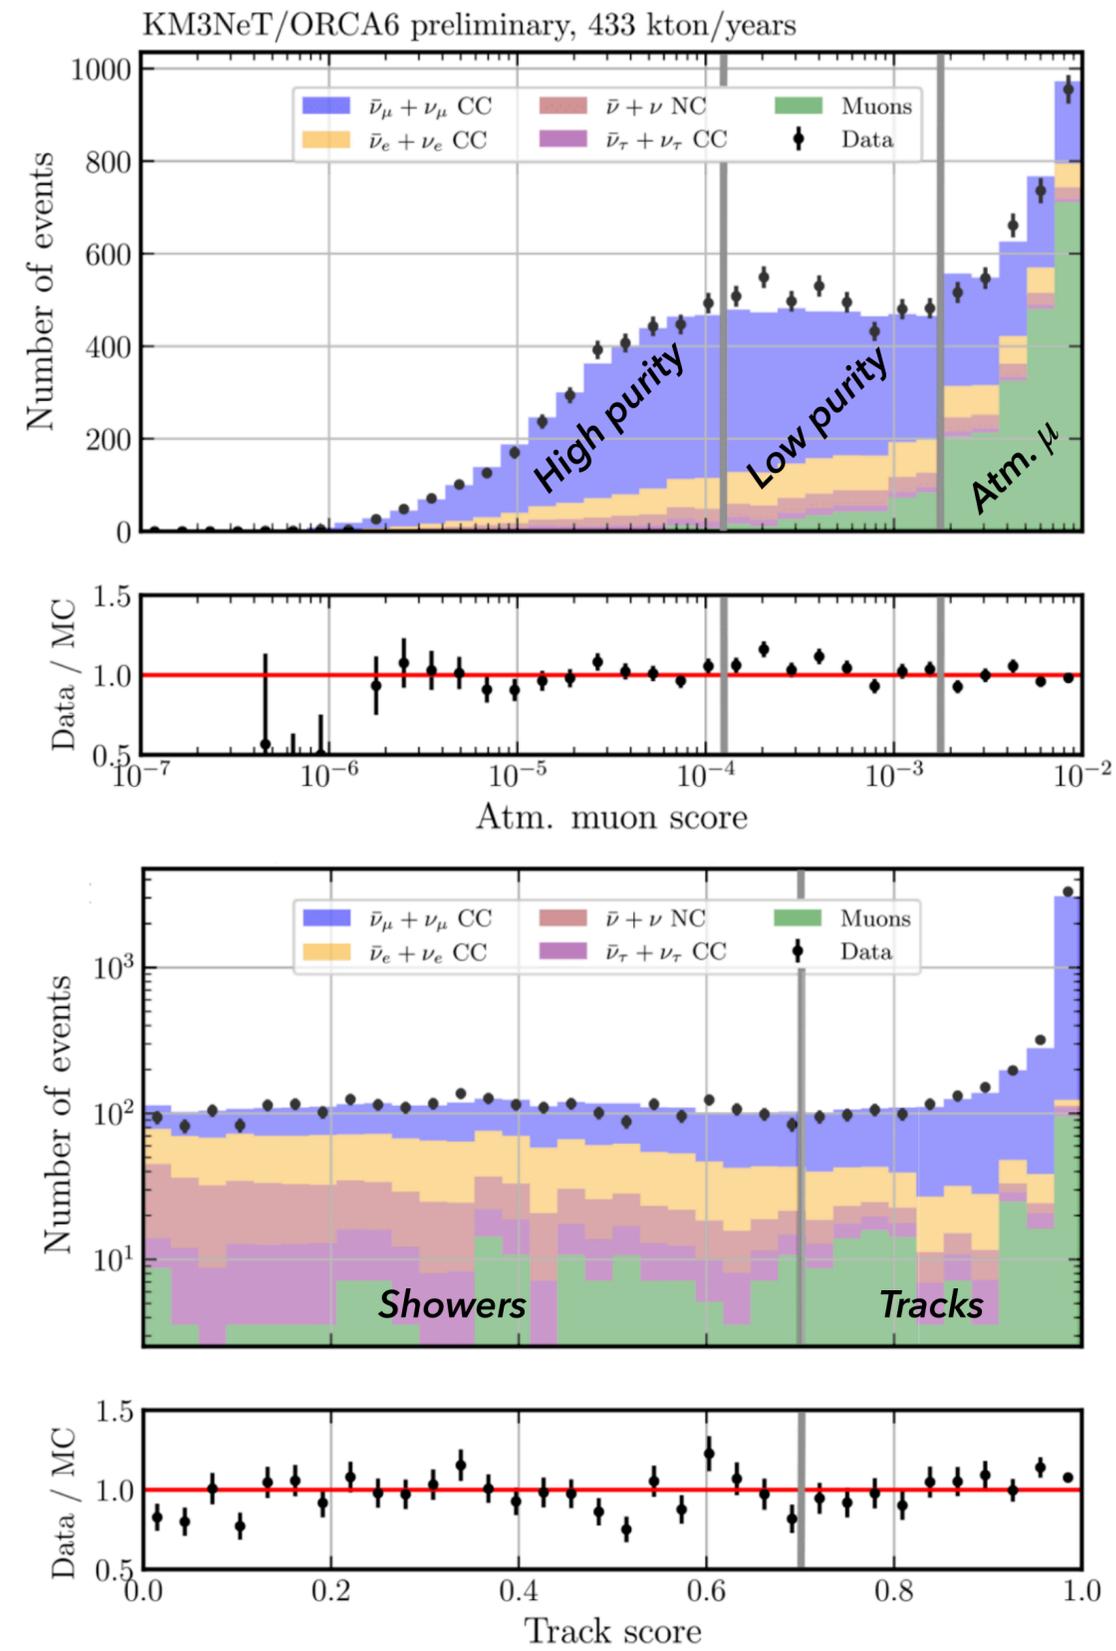

Event selection and data sample

- **BDT algorithm** for background rejection and track-shower separation
 - trained on MC (maximum likelihood algorithm's variables)
 - **challenging classification at low E**: 70% track-purity below 30GeV
 - **three classes**: high/low purity track, and showers

	all events	showers	tracks (HP)	tracks (LP)
MC	5831	1959 *	1870	2002
Data	5828	1958	1868	2002

(*expected $\nu_\tau = 185 \pm 1$ in the standard 3ν -paradigm)

- **remarkable statistics**: ν_τ mostly reconstructed in the shower class

I. Cerisy, C. Lastoria et al., Pos ICRC2023 (2023) 1191

Analysis method

- 2D bin log-likelihood minimization of \mathbf{E}_{reco} and $\cos\theta_{\text{reco}}$ distributions

- **oscillation hp \otimes flux model \otimes cross-section \otimes detector response**

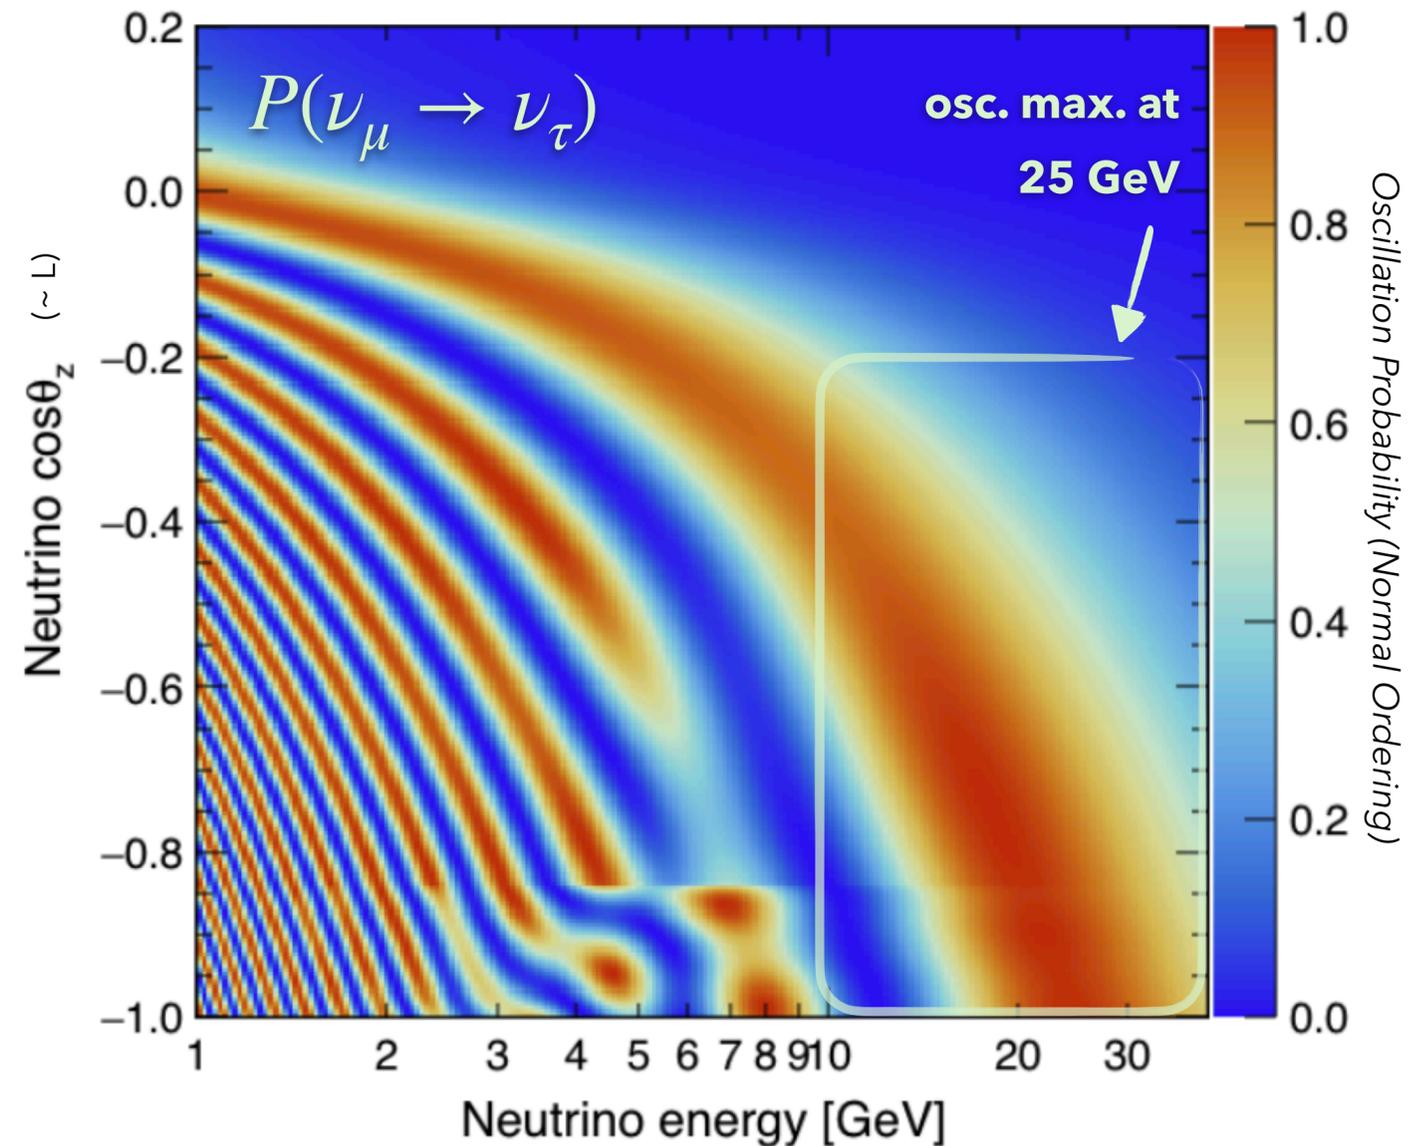

- assuming both normal and inverted ordering

- Δm_{31}^2 and θ_{23} free

- **ν_τ -normalization**

$$\frac{\text{n. of observed } \nu_\tau}{\text{n. of expected } \nu_\tau |_{\text{tested osc. model}}}$$

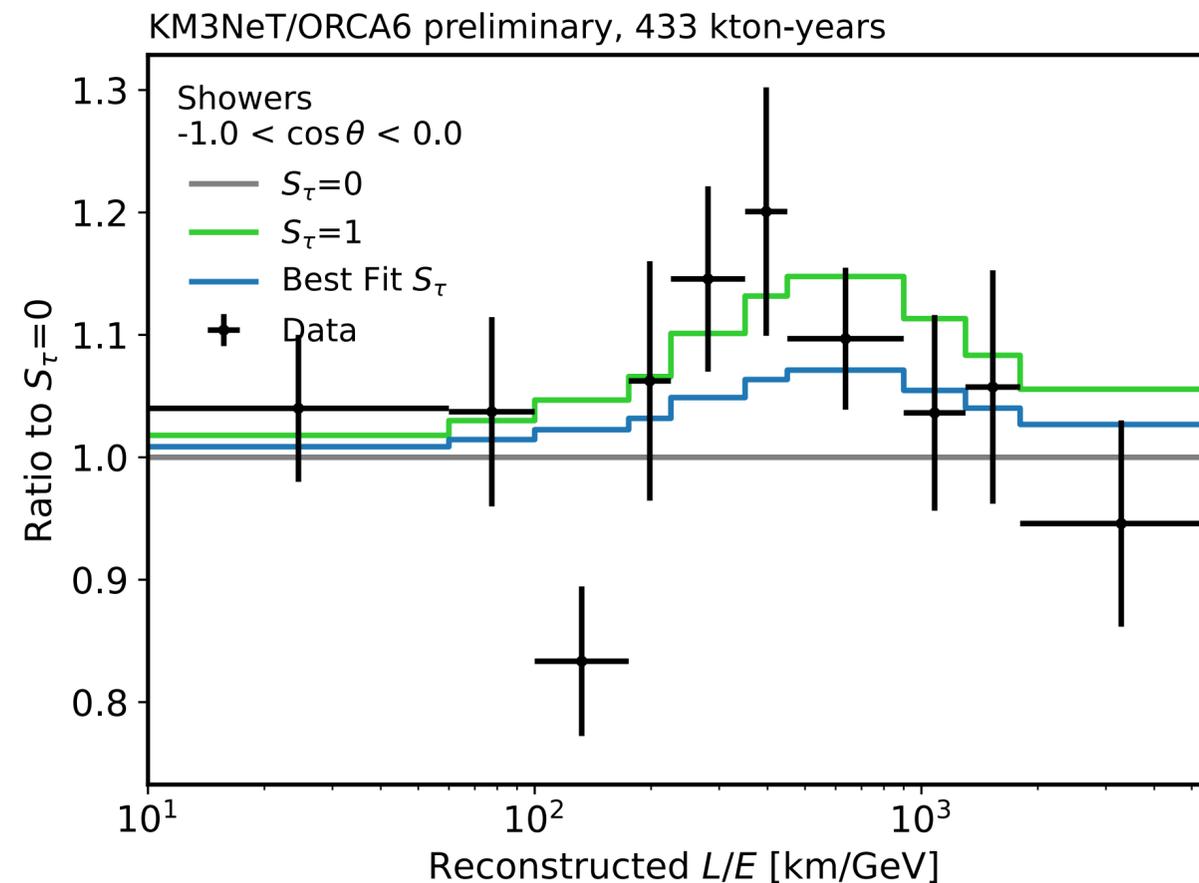

- two tested hypotheses, assuming or not the PMNS matrix unitarity

ν_τ normalisation within the 3ν flavour paradigm

a) S_τ : PMNS unitarity hypothesis

- ν_τ -norm. $\neq 1$, due to ν_τ charge-current cross-section modelization
- impact on ν_τ -CC rate

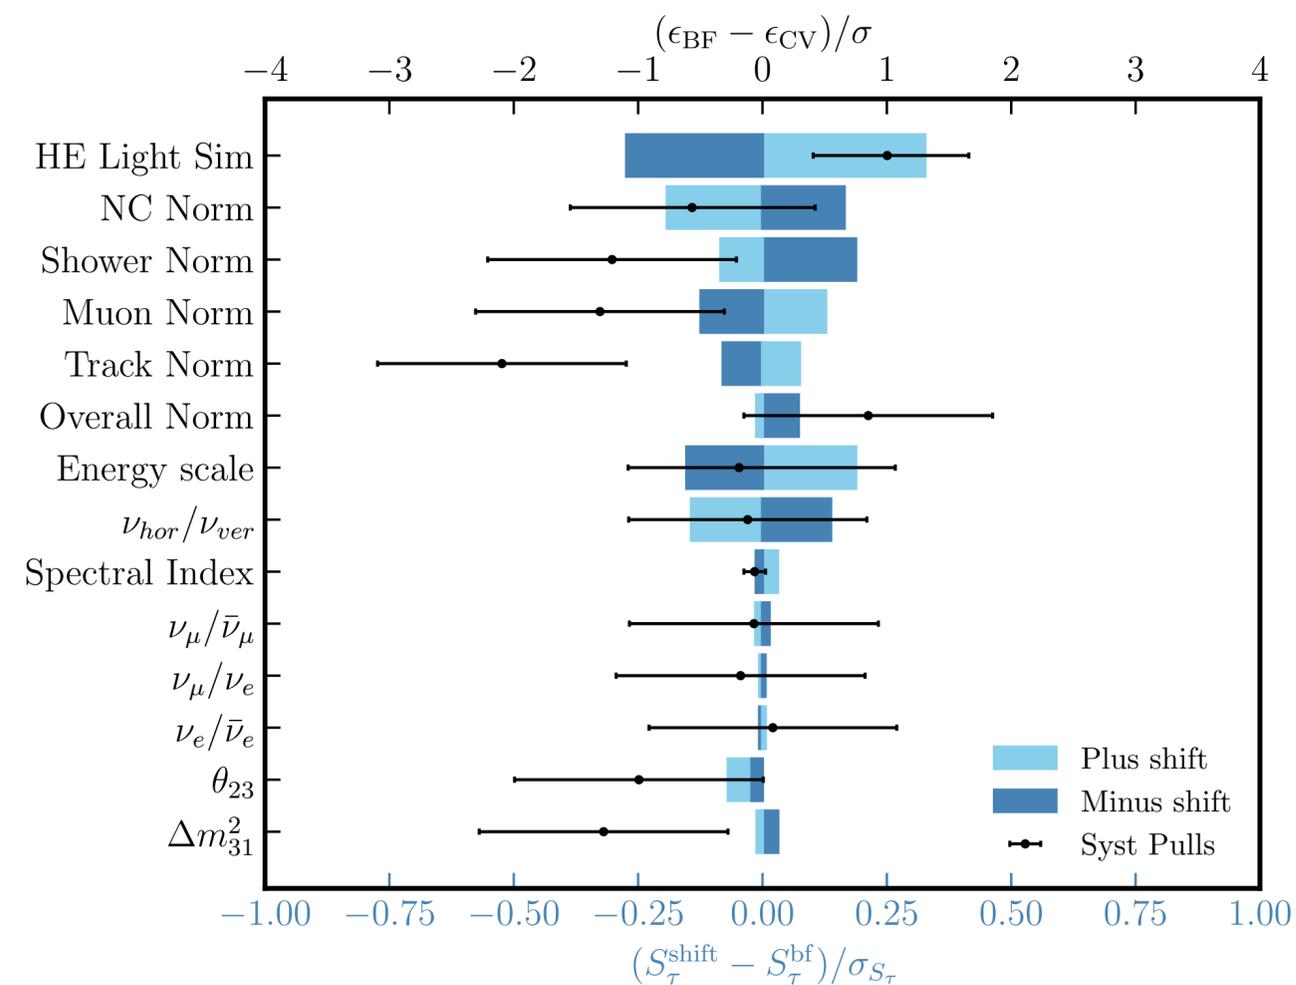

Excess in the shower class under the two extreme hypotheses on ν_τ -normalisation (equal to 0 or 1)

ν_τ normalisation within the 3ν flavour paradigm

a) S_τ : PMNS unitarity hypothesis

- ν_τ -norm. $\neq 1$, due to ν_τ charge-current cross-section modelization
- impact on ν_τ -CC rate

	Parameter	Constraint
atmospheric neutrino flux	flux δ_γ	0.3
	shape δ_θ	2%
	neutrino $s_{\mu\bar{\mu}}$	5%
	composition $s_{e\bar{e}}$	7%
	$s_{\mu e}$	2%
neutrino interactions	f_{NC}	20%
detector response	light E_s	9%
	propag. f_{HE}	50%
	f_{all}	unconstrained
	overall f_{HPT}	unconstrained
	norms f_S	unconstrained
	f_μ	unconstrained

Main sources of **systematics** and their impact on the fit

ν_τ normalisation measurement

- strong complementarity among the different experiments
 - neutrino energy, source, and identification techniques
 - fit method and sensitivity to other oscillation parameters

no statistically robust rejection of the 3ν -flavor paradigm

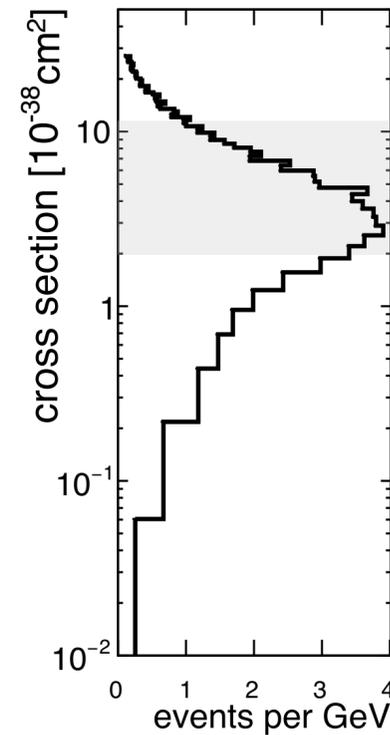

ν_τ -CC cross-section constraint

- ν_τ -normalization behaves as **scaling factor** for the measured ν_τ -CC cross-section: $\sigma_{meas} = S_\tau \times \langle \sigma_{theory} \rangle$
- additional inputs to **constrain cross-section** (sensitivity to different energy ranges and interaction media)

Non-Unitary Neutrino Mixing (NUNM)

b) α_{33} : nxn unitarity matrix

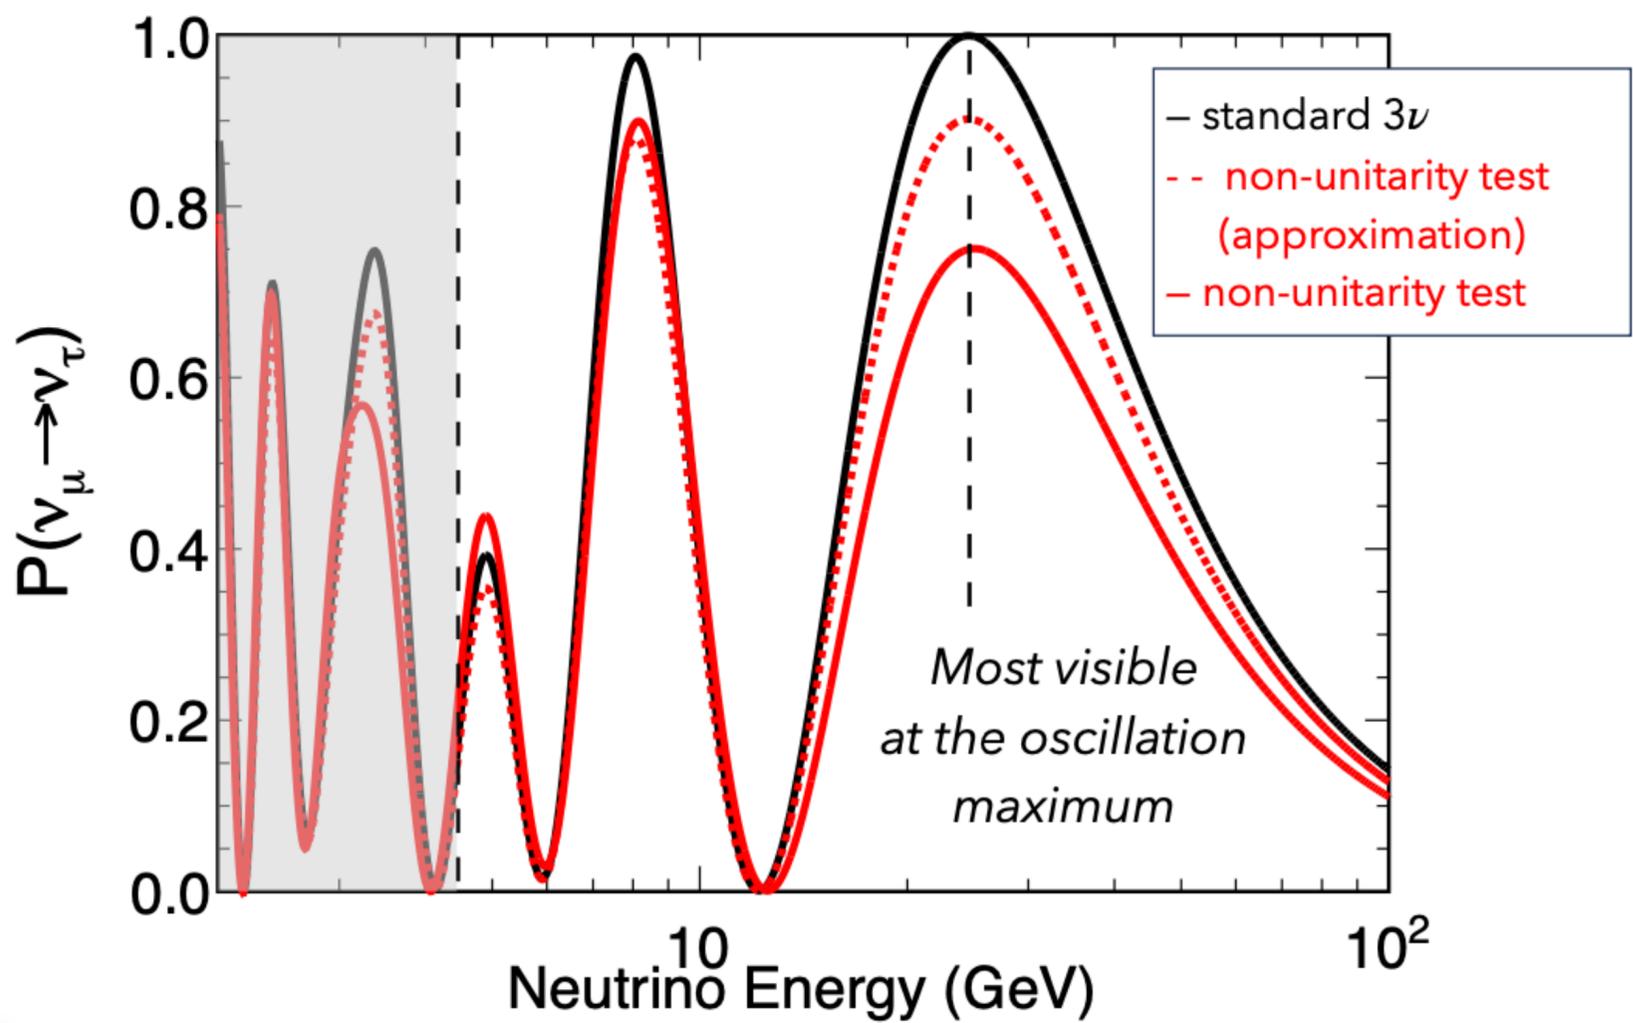

- **Heavy Neutral Leptons** (seesaw mechanism for neutrino masses generation)
- oscillation probabilities impacted by α_{33}

$$P_{\beta}^{\alpha} = P_{\beta e} + P_{\beta \mu} + \alpha_{33}^2 P_{\beta \tau}$$

- **interaction also with neutrons in the Earth**
(non-negligible V_{NC} potential)

First test on atmospheric neutrinos data

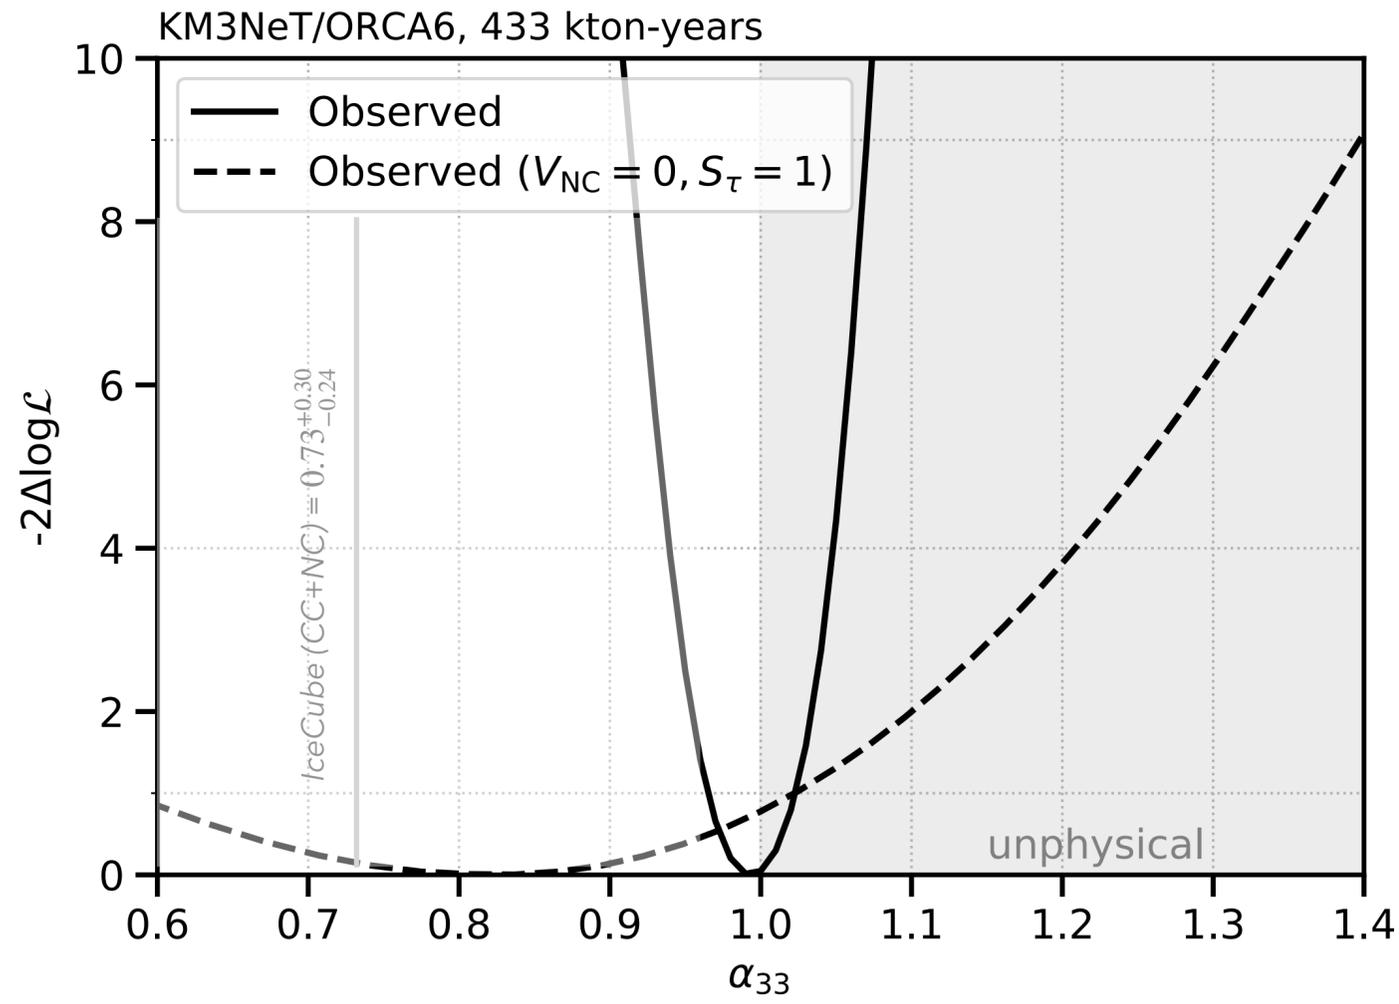

Non-Unitary Neutrino Mixing (NUNM)

- impact on both CC and NC rates
- at the best fit,

$\alpha_{33} = 0.83^{+0.20}_{-0.25}$ (if $V_{NC} = 0, S_{\tau} = 1$)
 $\alpha_{33} = 0.993^{+0.026}_{-0.025}$ (otherwise)

	$(V_{NC}=0, S_{\tau}=1)$
n. of ν_{τ} -CC	132^{+60}_{-61}
n. of NC	313^{+11}_{-13}

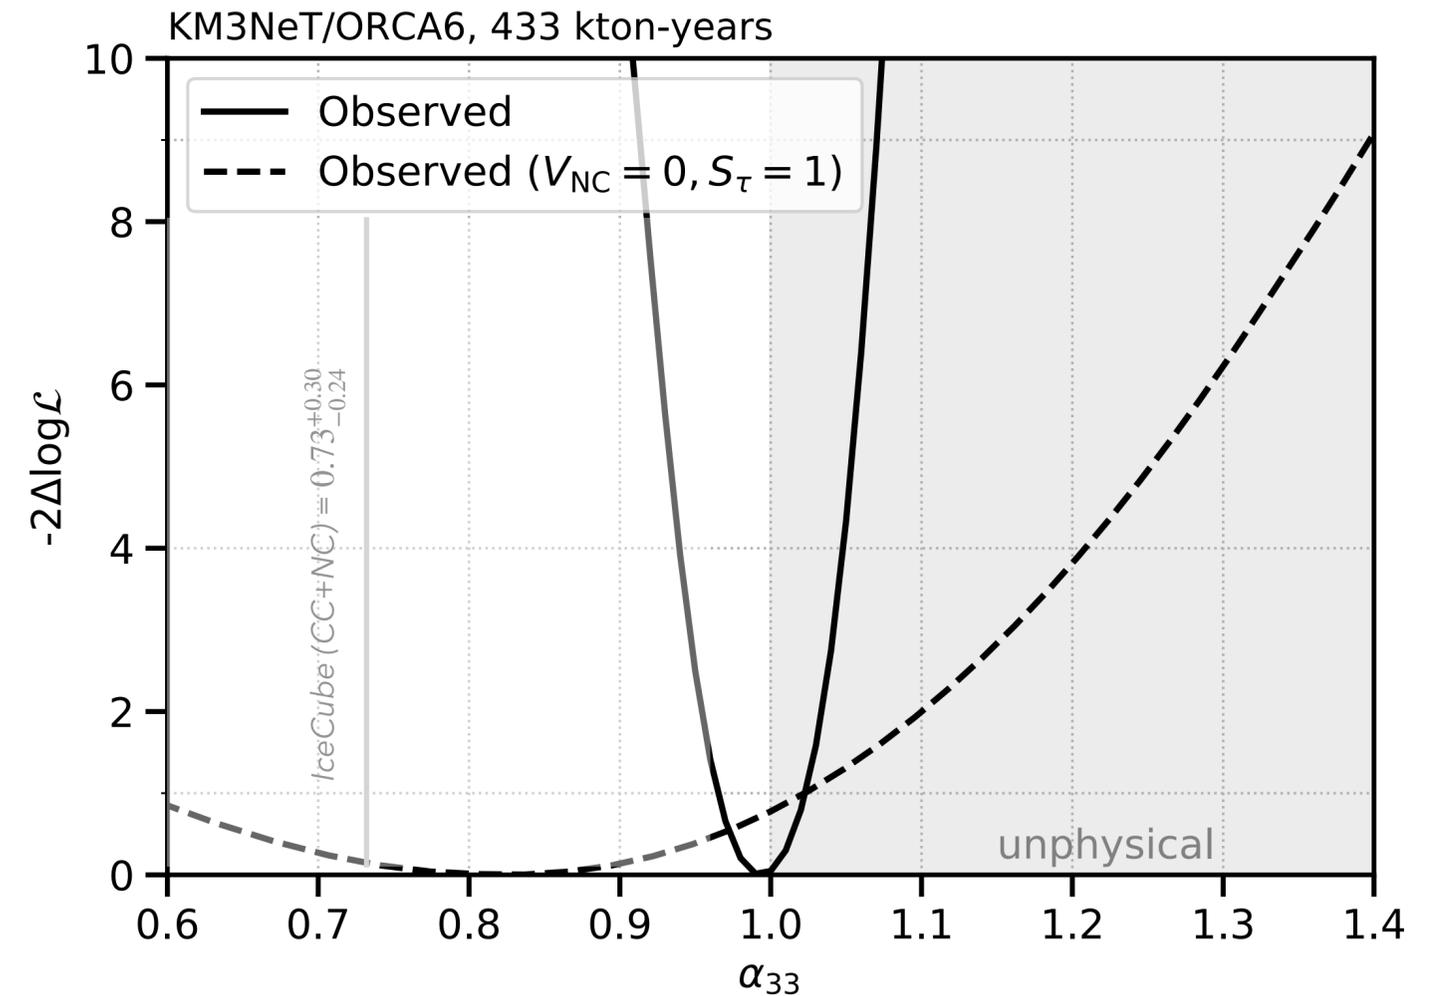

Non-Unitary Neutrino Mixing (NUNM)

- impact on both CC and NC rates
- at the best fit,

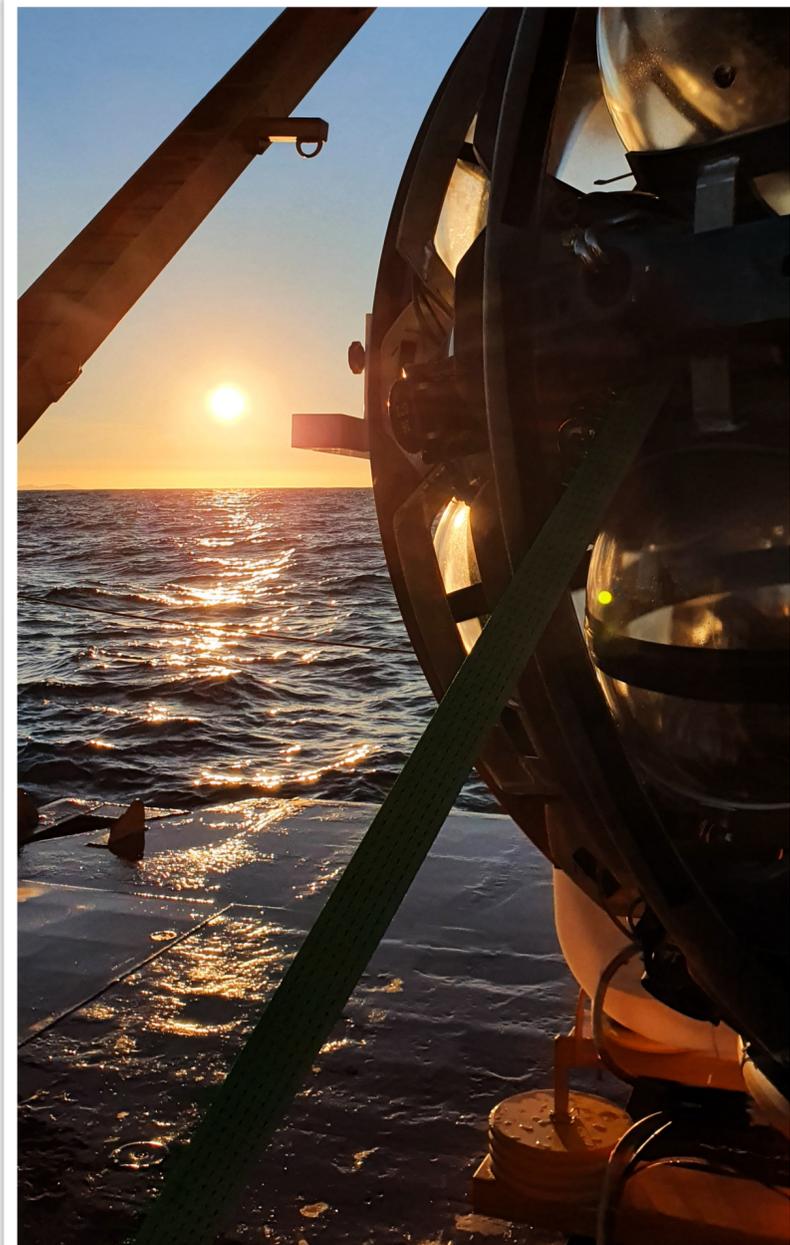

○ $\alpha_{33} = 0.83^{+0.20}_{-0.25}$ (if $V_{\text{NC}} = 0, S_{\tau} = 1$)

○ $\alpha_{33} = 0.993^{+0.026}_{-0.025}$ (otherwise)

	$(V_{\text{NC}}=0, S_{\tau}=1)$	$(V_{\text{NC}} \neq 0, S_{\tau} \text{ free})$
n. of ν_{τ} -CC	132^{+60}_{-61}	170^{+5}_{-9}
n. of NC	313^{+11}_{-13}	325^{+1}_{-4}

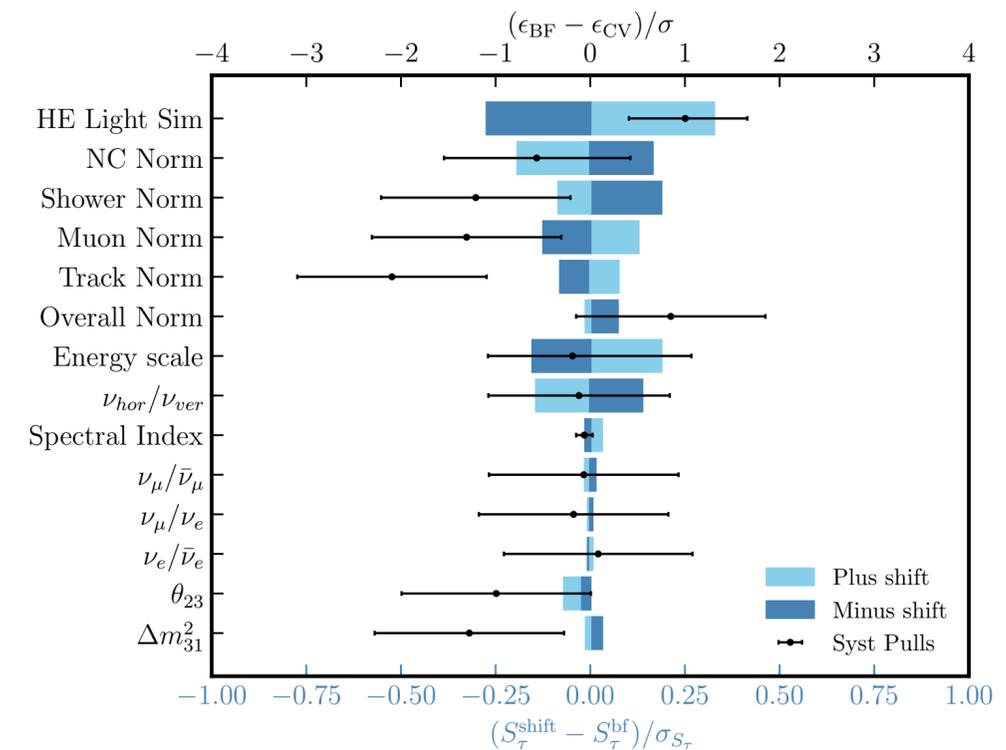

current best limit on α_{33} : [0.95, 1.04] at 95% CL

- **The role of neutrinos in astrophysics and particle physics**
 - neutrino telescopes in multi-messenger astronomy
 - open questions in neutrino oscillation physics
- **The KM3NeT experiment**
 - detection principle and technology
 - from installation to physics data
- **An unexpected *surprise*: the ultra-high energetic (UHE) neutrino**
- **First look at atmospheric neutrino oscillations in KM3NeT/ORCA data**
 - selection of the ν sample
 - ν_τ appearance analysis
 - neutrino mixing non-unitarity test
- **Summary and prospects**

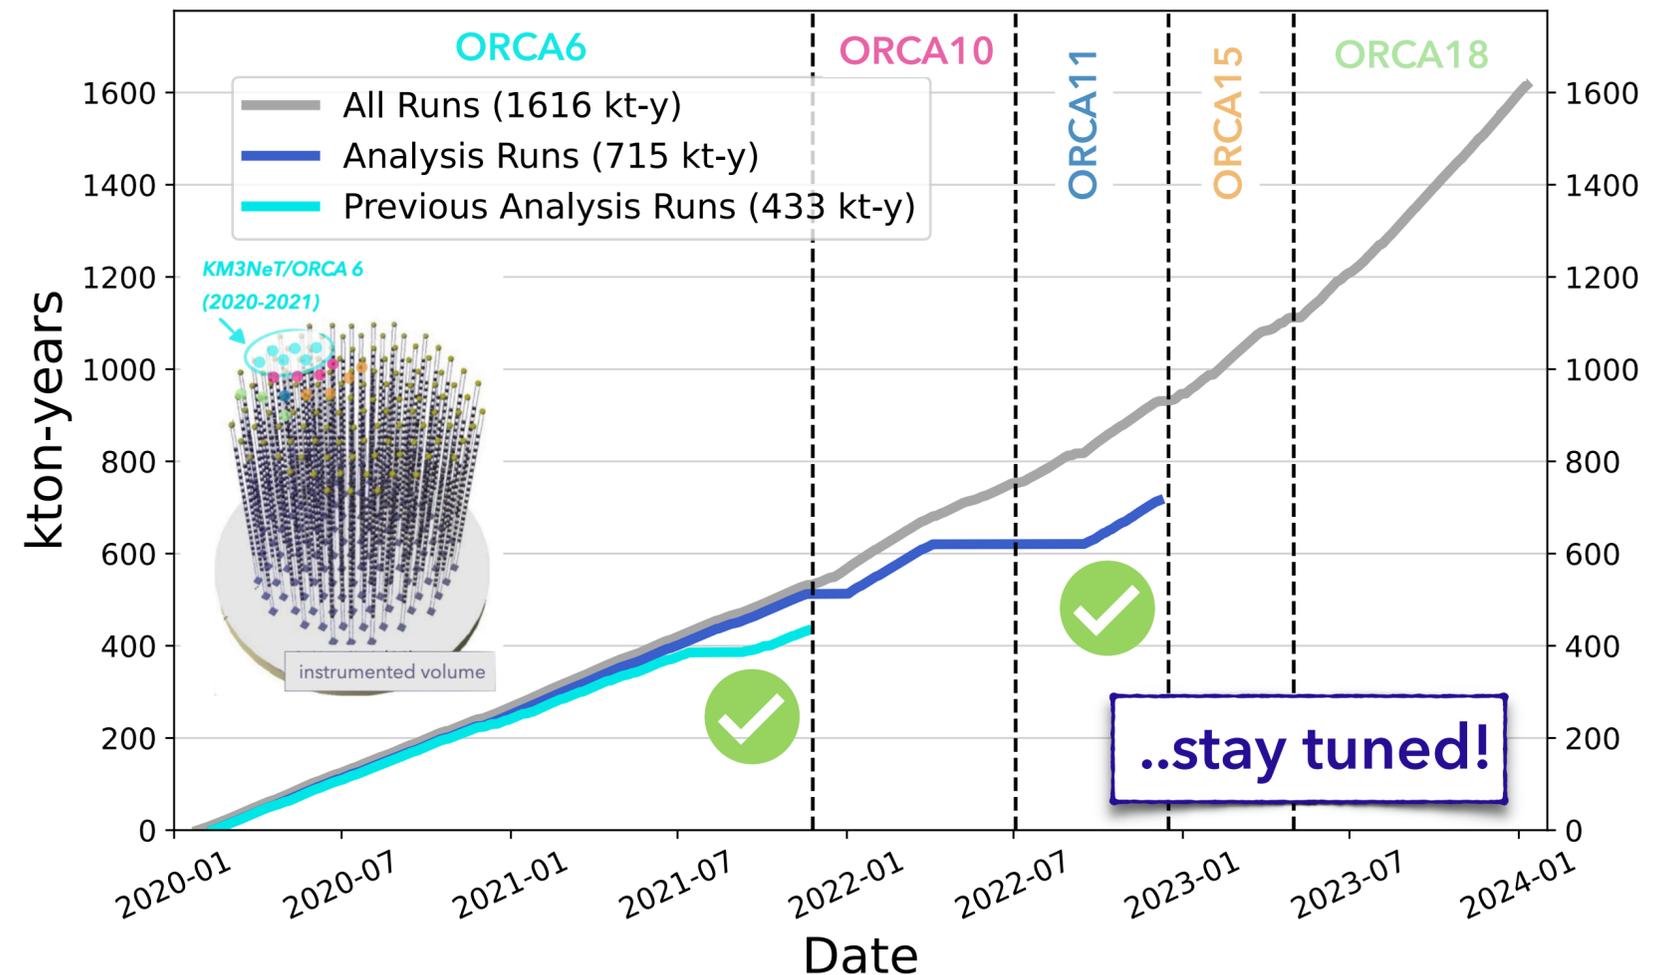

Impact, limitations and prospects

- Precise measurement of ν_τ **appearance** is a key study to deepen the understanding of neutrino properties
 - test the **3 ν flavor paradigm**
 - **BSM non-unitarity extensions** and alternative seesaw mechanisms - [Nucl.Phys.B 1013 \(2025\) 116853](#)
- **Exploration of KM3NeT/ORCA 6 data demonstrated the experiment potential in the field**
 - comparable performance with other experiments in the standard 3 ν flavor paradigm
 - **non-unitarity mixing matrix parameters in the atmospheric sector**
 - is a key measurement to evaluate the **impact of non-unitarity on oscillation probabilities** - [Nucl.Phys.B 1017 \(2025\) 116944](#)
 - KM3NeT measurement is leading the **current world-wide best limit on α_{33}**
 - ORCA6 pointed out some **limitations in the set of systematics**
used both in standard and NUNM analyses

Impact, limitations and prospects

- **analyses of larger configurations** are in the pipeline!
 - expected $\nu_\tau \sim 420/\text{year}$ (CC) in 16% active volume (e.g. ORCA18)
 - toward 3000 ν_τ/year (CC) in full ORCA
- alternative **Deep Learning techniques** are under study (e.g. transformers and ν_τ tagging)
- **extend current set of systematics and fit methods** (e.g. Bayesian approach)
 - better understanding of the detector response
 - enhanced purity of the shower class

Wrapping up and outlook

- **Neutrinos are unique *messengers* able to bridge astroparticle and particle physics**
 - neutrino telescopes allows for exploring our Universe over very large distances
 - focusing on atmospheric neutrinos, these telescopes allows to answer crucial questions in oscillation physics
- Thanks to its active volume, **KM3NeT will exploit an unprecedented statistics**
 - data collected in other configurations are being analysed
 - **ARCA** has shown its enormous potential to cover a central player in **multi-messenger astronomy**
 - **ORCA** is ready to aim at measuring the **neutrino mass ordering**

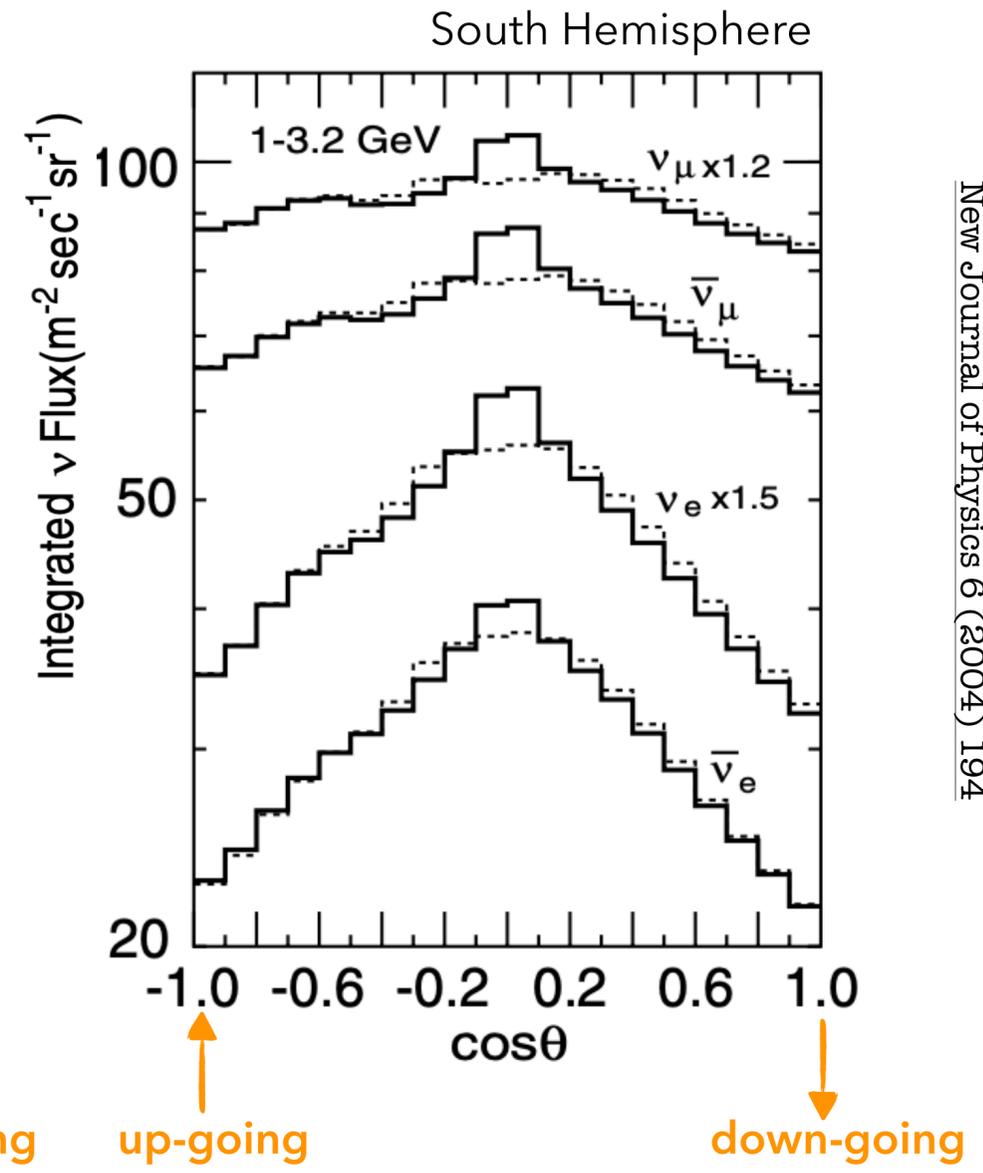

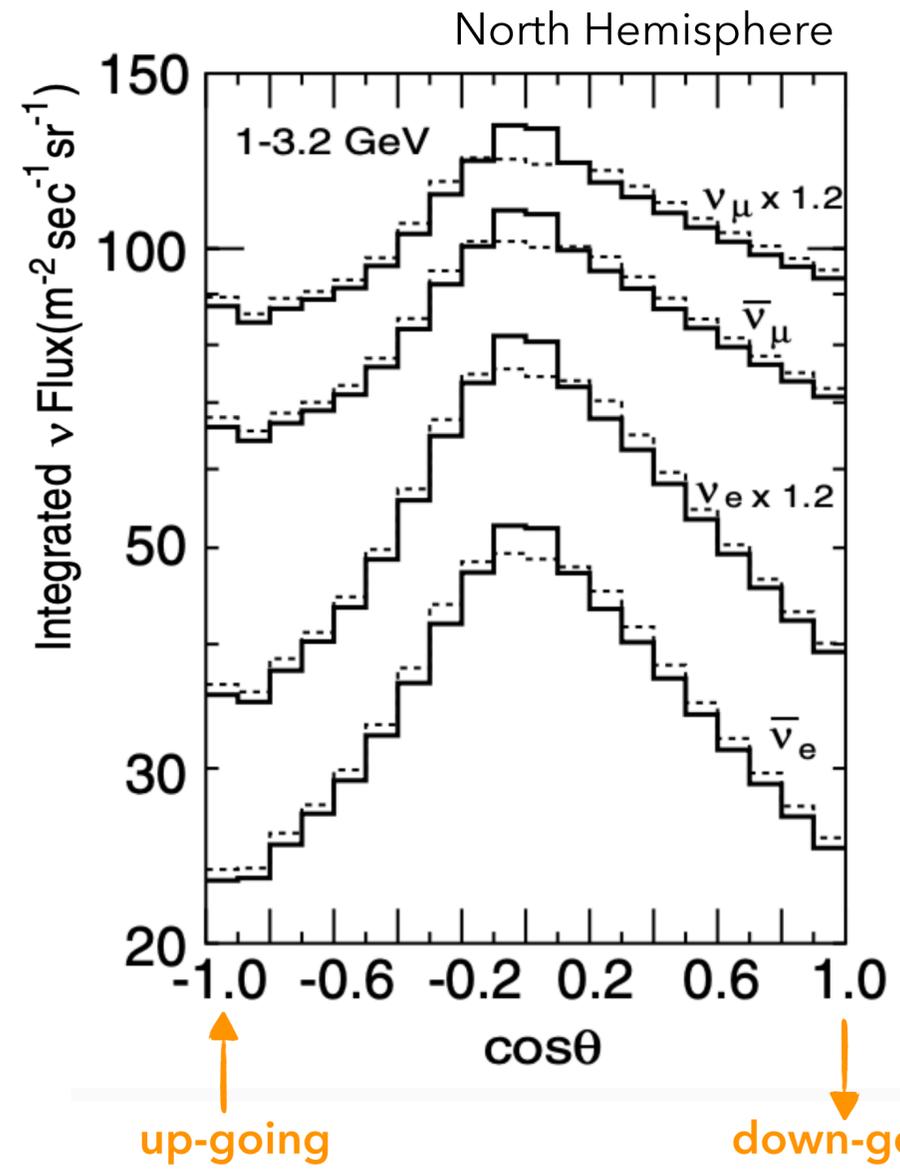

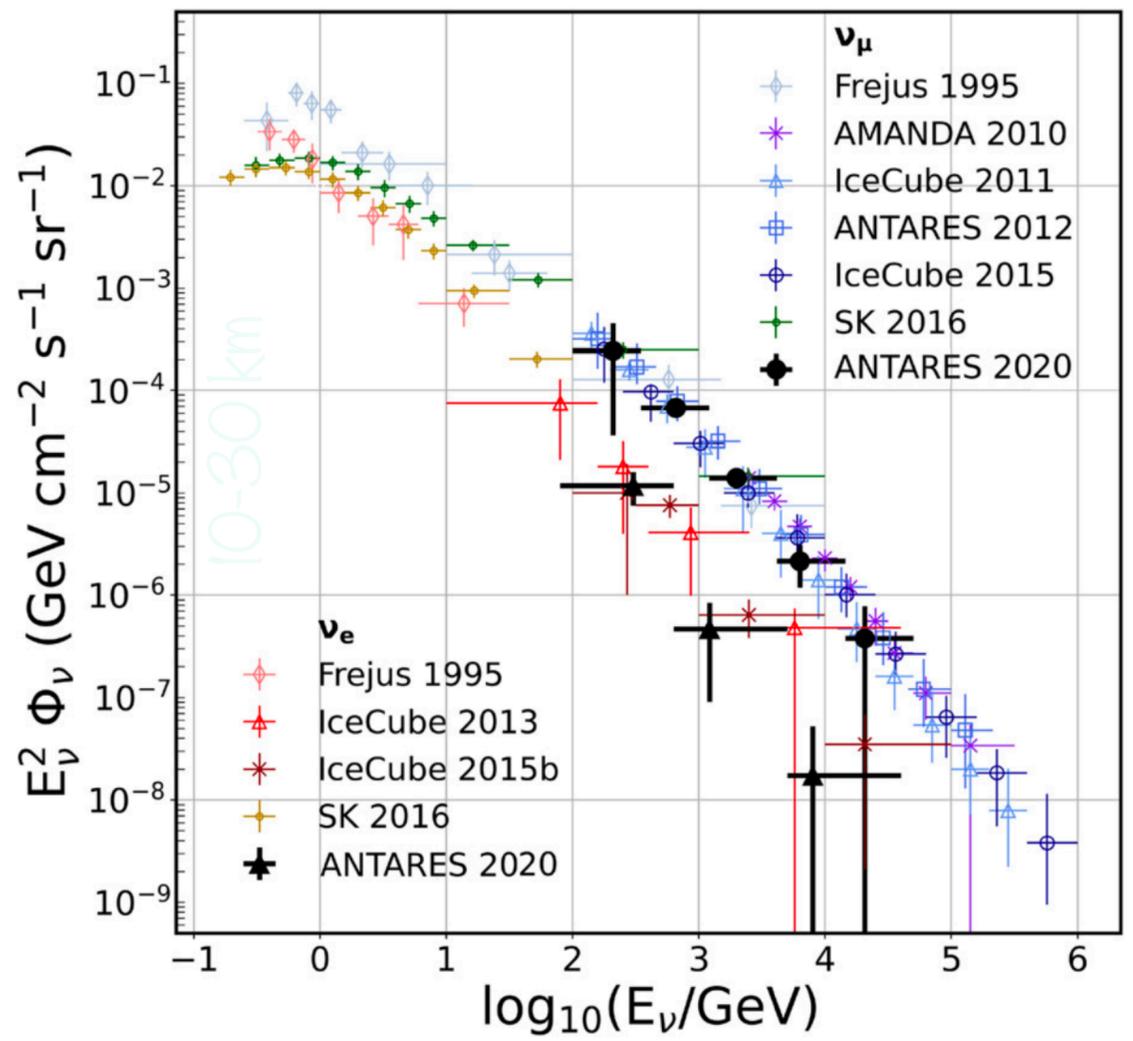

...thanks a lot for your attention !

Data Quality workflow

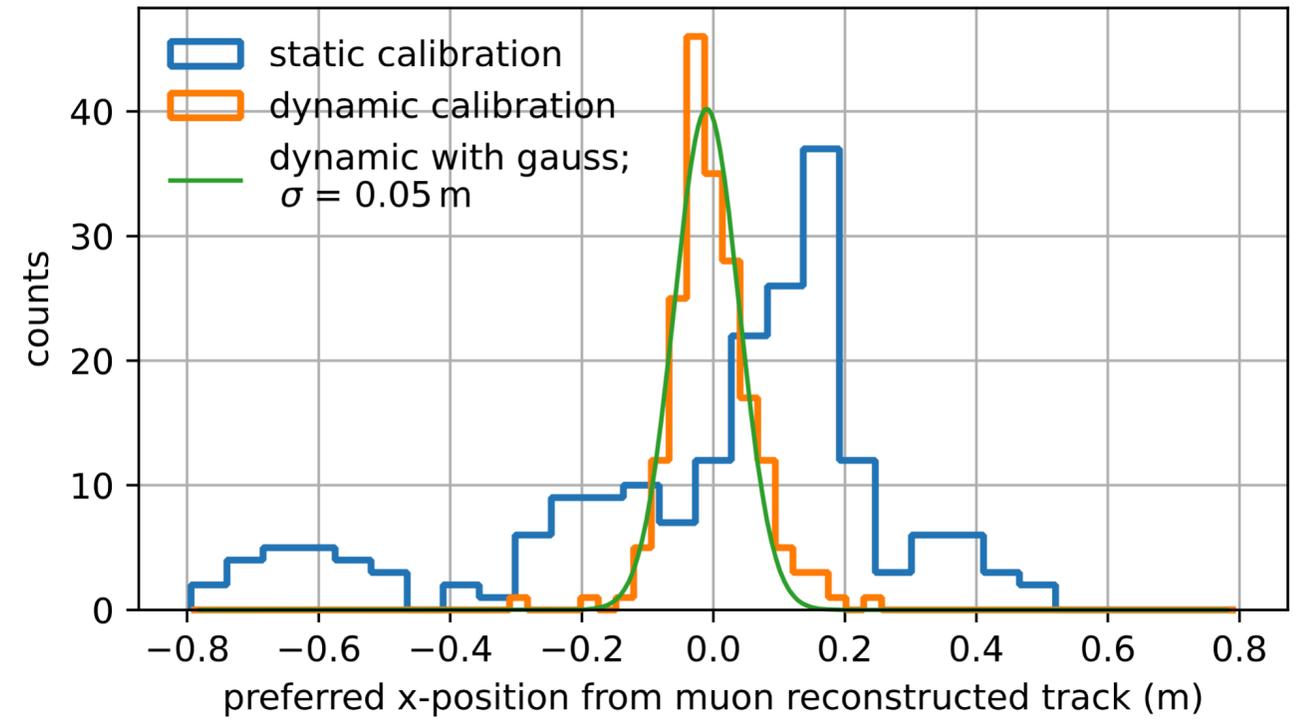

~ 4 years of data taking in ORCA configurations: 6 to 18 DUs

Event reconstruction in KM3NeT/ORCA 6

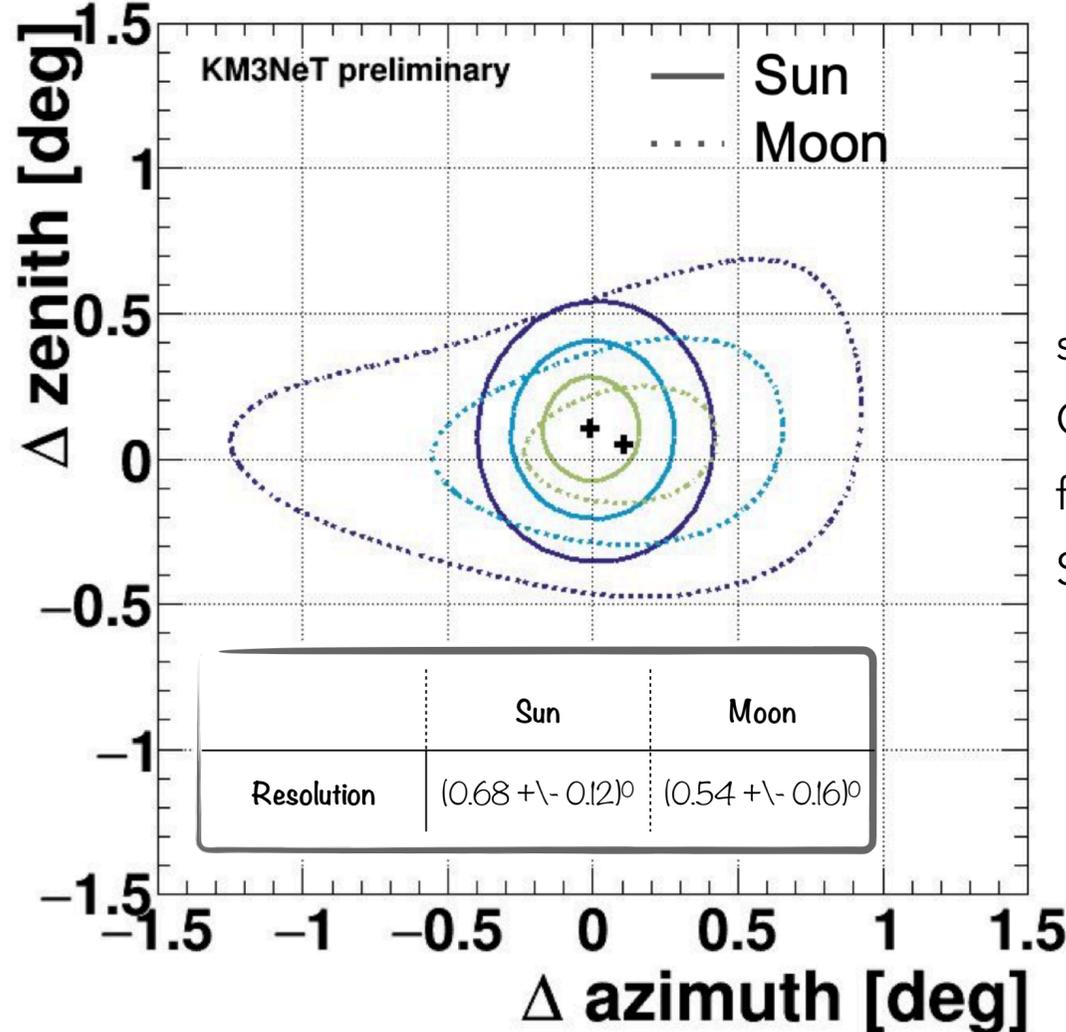

- DU calibration allows for precise alignment measurement
- detector resolution in track reconstruction < 1 degree (important for pointing)

< 10 cm resolution possible with dynamic calibration

KM3NeT Coll. at Neutrino 2022

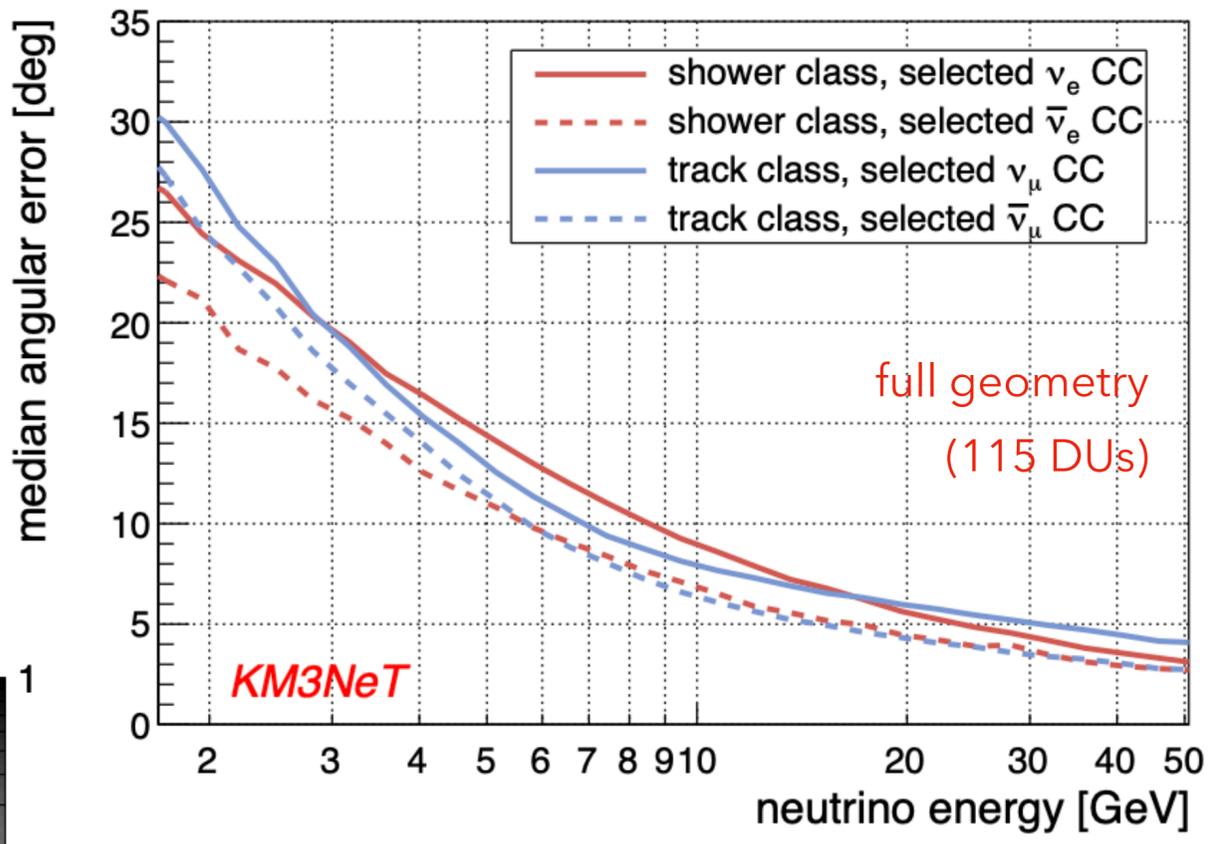

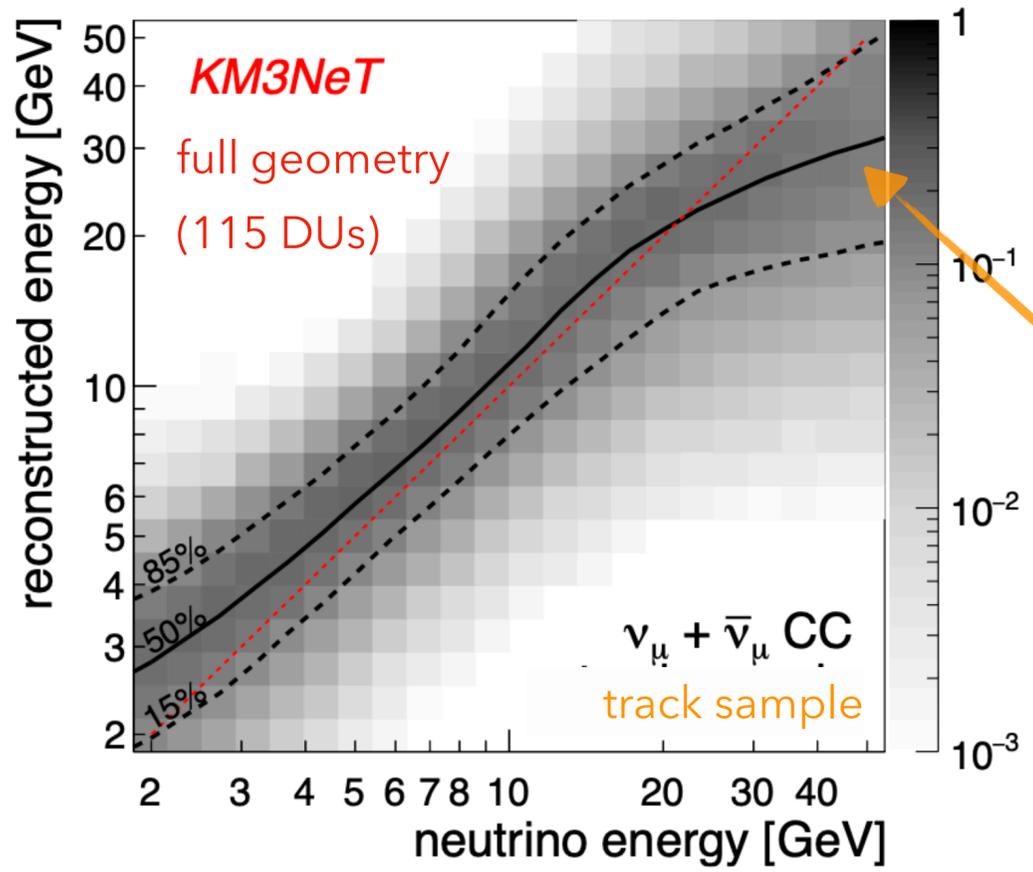

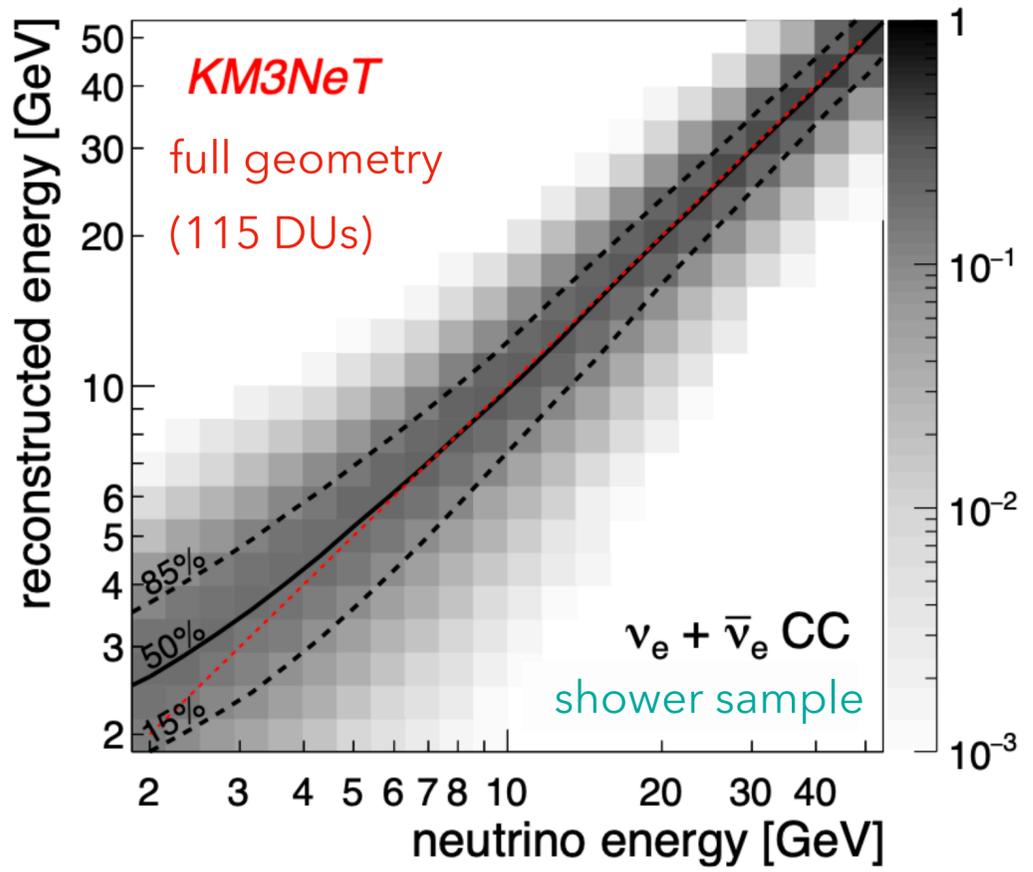

arXiv: 2211.08977

shadow in the CR flux due to the Sun and Moon

Full KM3NeT/ORCA reconstruction performance

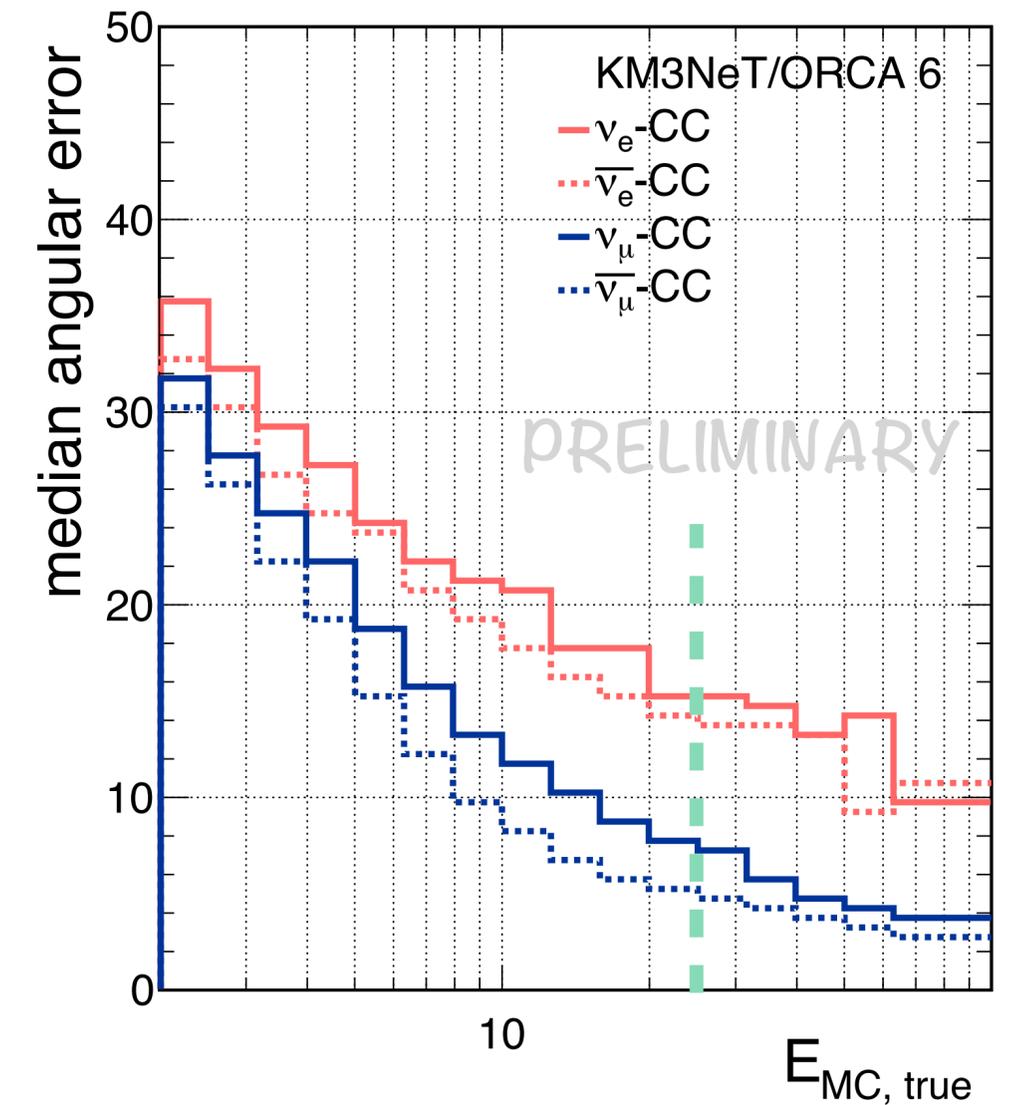

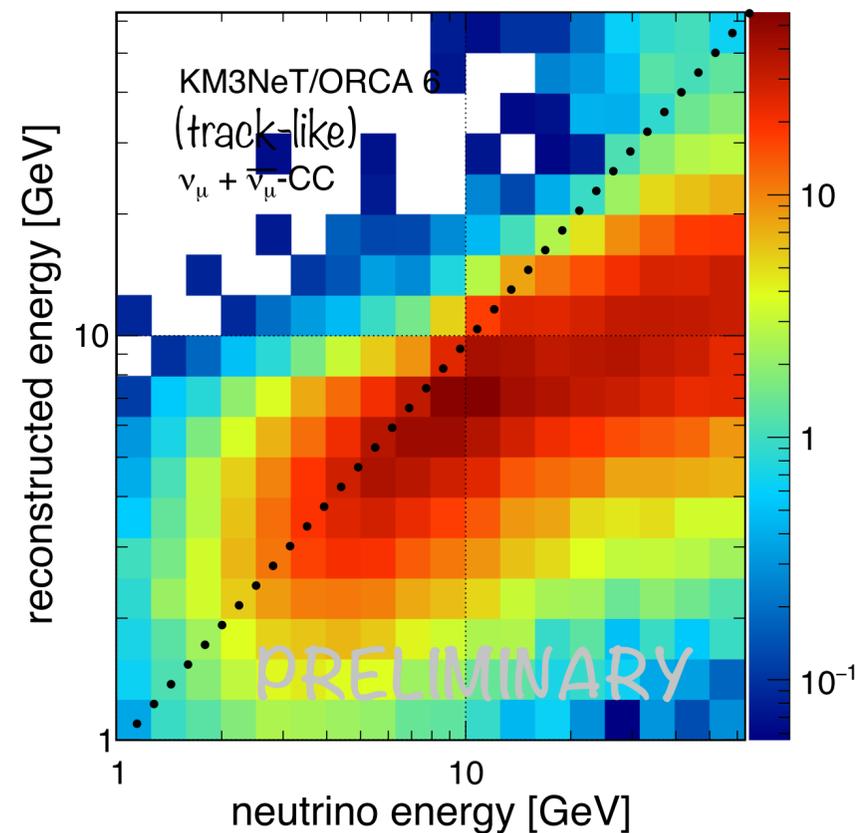

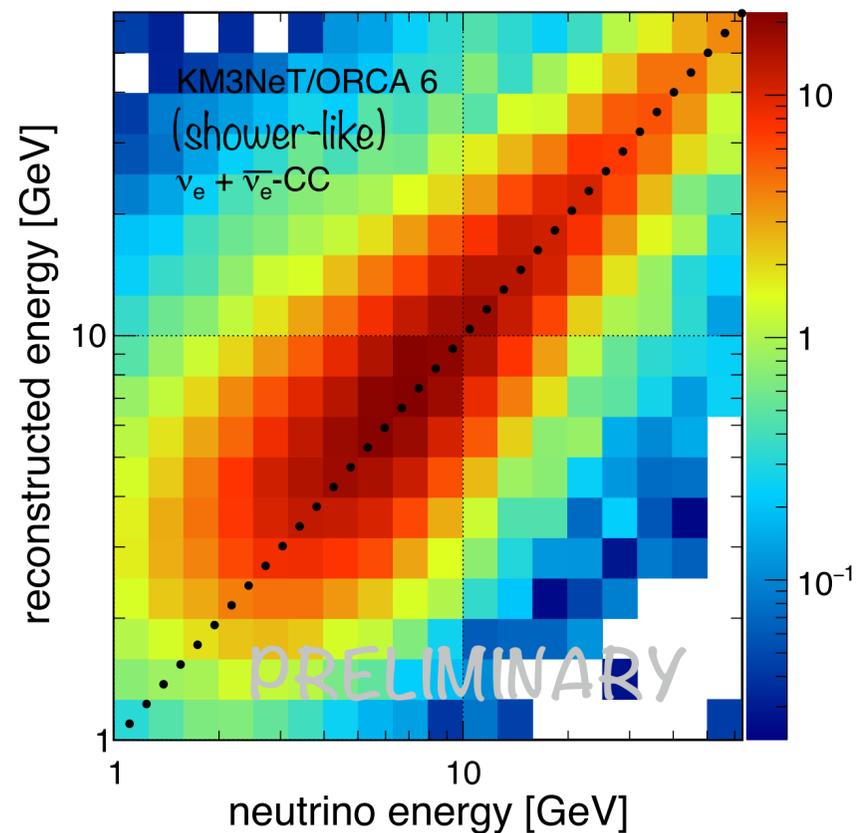

- Sensitivity to event reconstruction performance
 - up to 5° resolution for both topologies
 - linear energy estimation in the full energy range

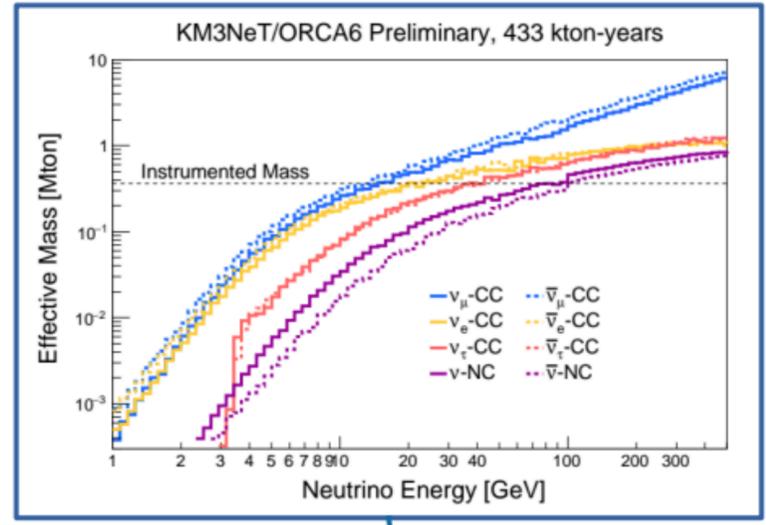

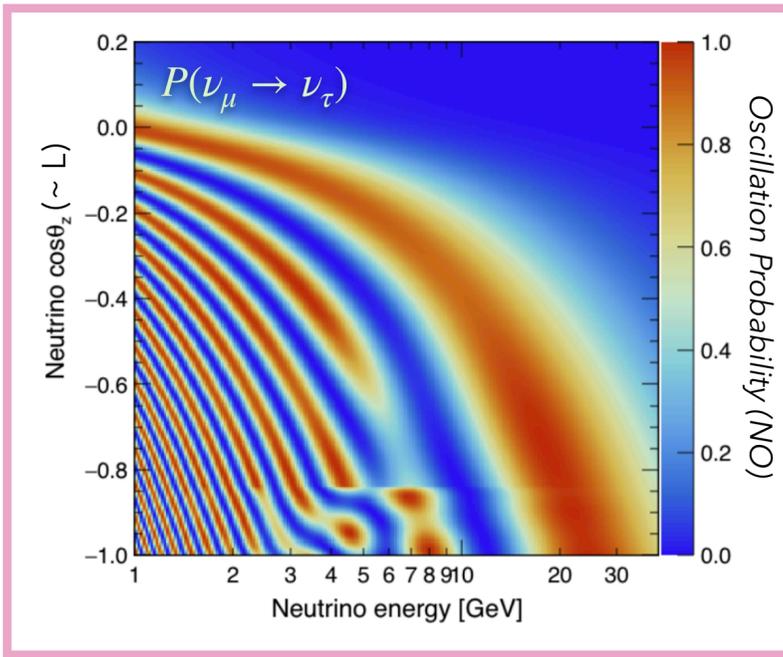

very elongated events (real int. vertex, outside the instrum. vol.)

The shower topology reconstruction

- new shower reconstruction algorithm using **single-PMT information** (instead of single-DOM)
 - intrinsic limitation in angular shower resolution in small geometries
 - overall linear energy estimation for both topologies
 - overall good data/MC comparison for both algorithms

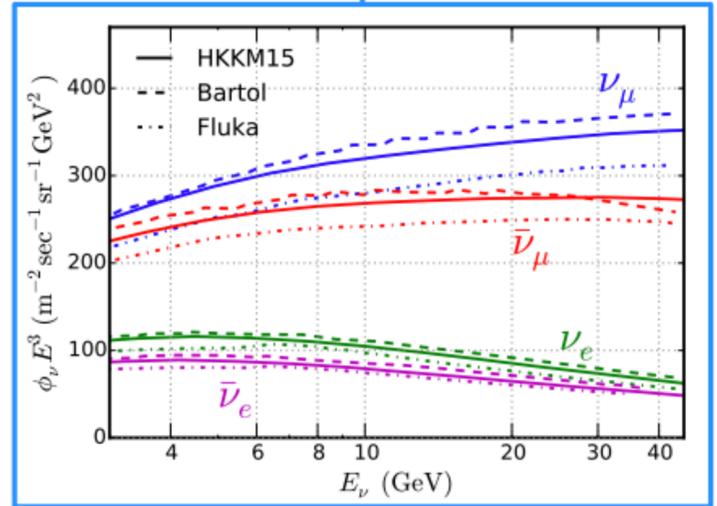

Analysis method

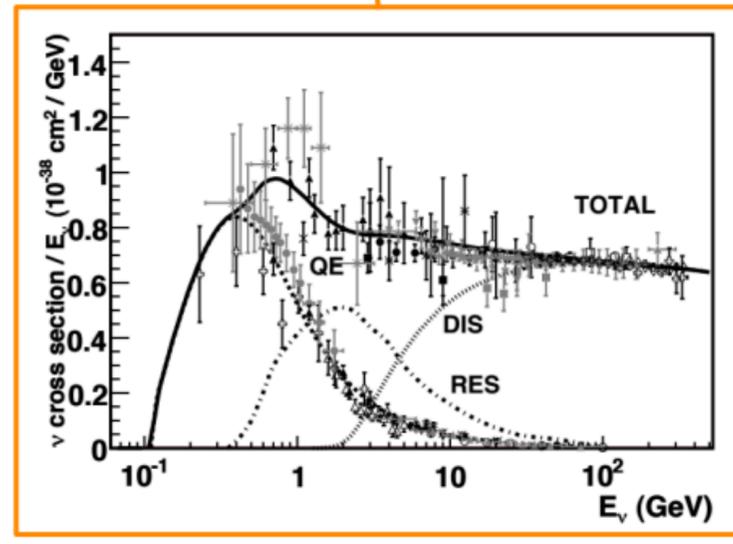

$$-2 \log \mathcal{L} = \sum_i 2 \left[\left(\beta_i N_i^{\text{mod}} - N_i^{\text{dat}} \right) + N_i^{\text{dat}} \ln \left(\frac{N_i^{\text{dat}}}{\beta_i N_i^{\text{mod}}} \right) \right] + \frac{(\beta_i - 1)^2}{\sigma_{\beta_i}^2} + \sum_k \left(\frac{\epsilon_k - \langle \epsilon_k \rangle}{\sigma_{\epsilon_k}} \right)^2$$

f_{HE}	$1.50^{+0.33}_{-0.30}$	$1.59^{+0.32}_{-0.29}$
f_{all}	$1.09^{+0.17}_{-0.11}$	$1.11^{+0.11}_{-0.12}$
f_{HPT}	$0.91^{+0.04}_{-0.04}$	$0.92^{+0.04}_{-0.04}$
f_S	$0.92^{+0.06}_{-0.06}$	$0.92^{+0.06}_{-0.06}$
f_μ	$0.5^{+0.44}_{-0.4}$	$0.51^{+0.4}_{-0.35}$
S_τ	PoI	$0.92^{+0.19}_{-0.18}$

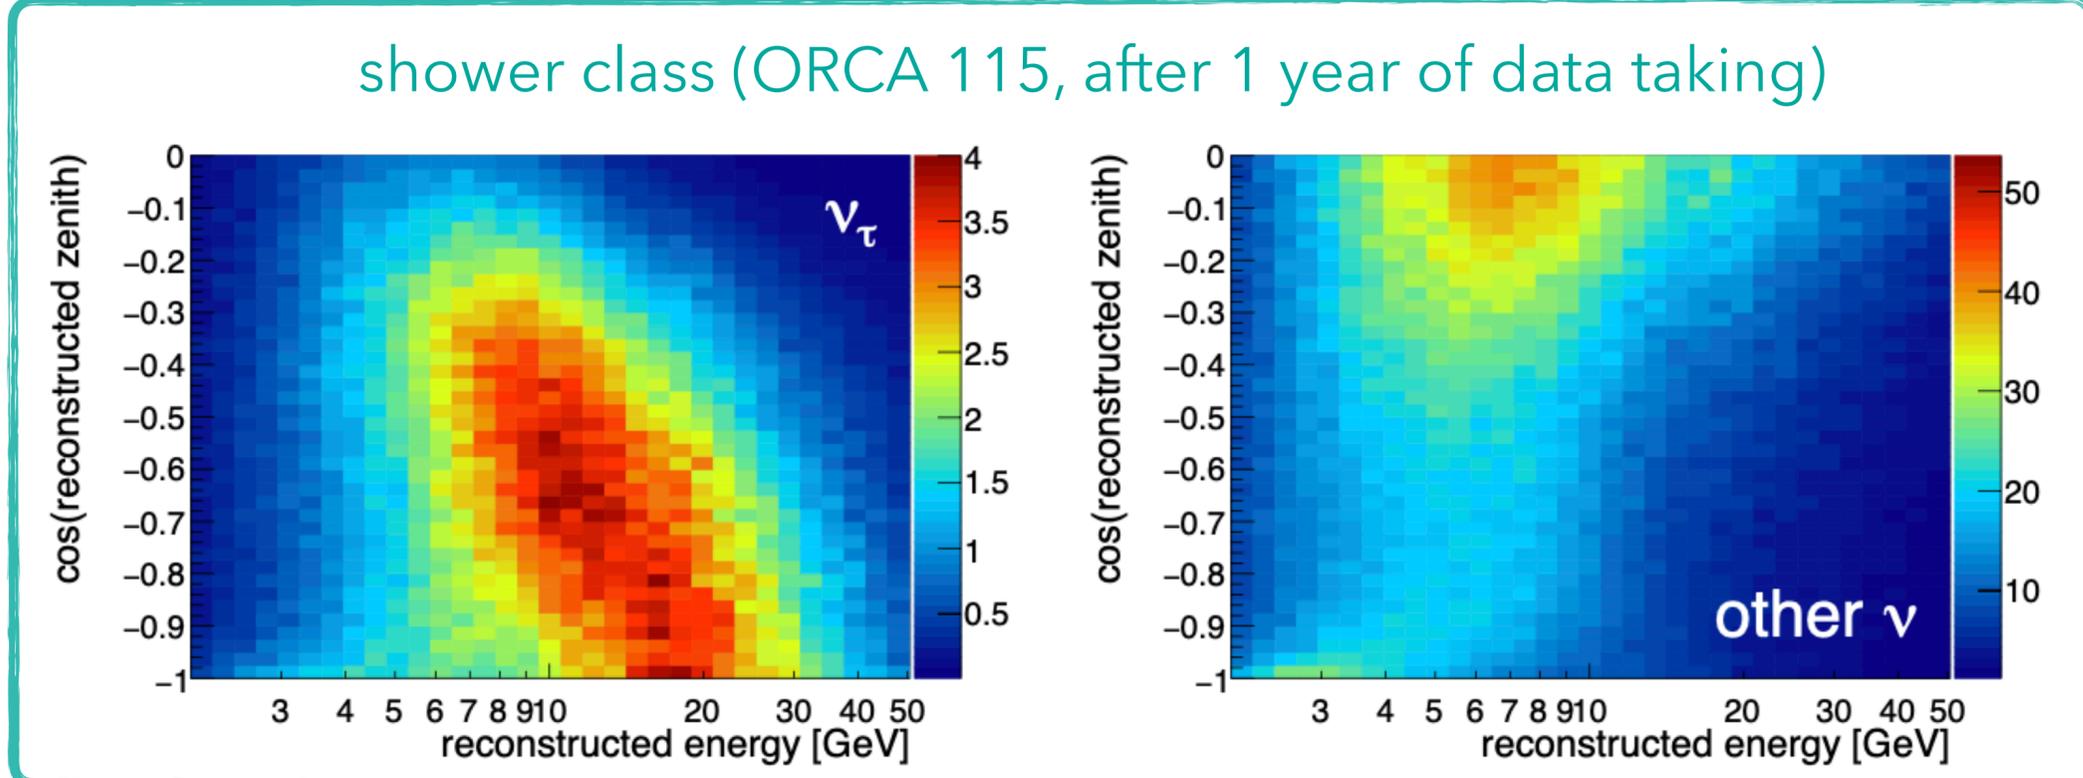

ν_τ -normalization, latest result from IceCube

- increased statistics: 11 years of data (~ 4 times the previous analysis)
- improved event selection and classification (deep learning techniques)
- enhanced understanding and treatment of ν_τ simulation and cross-section

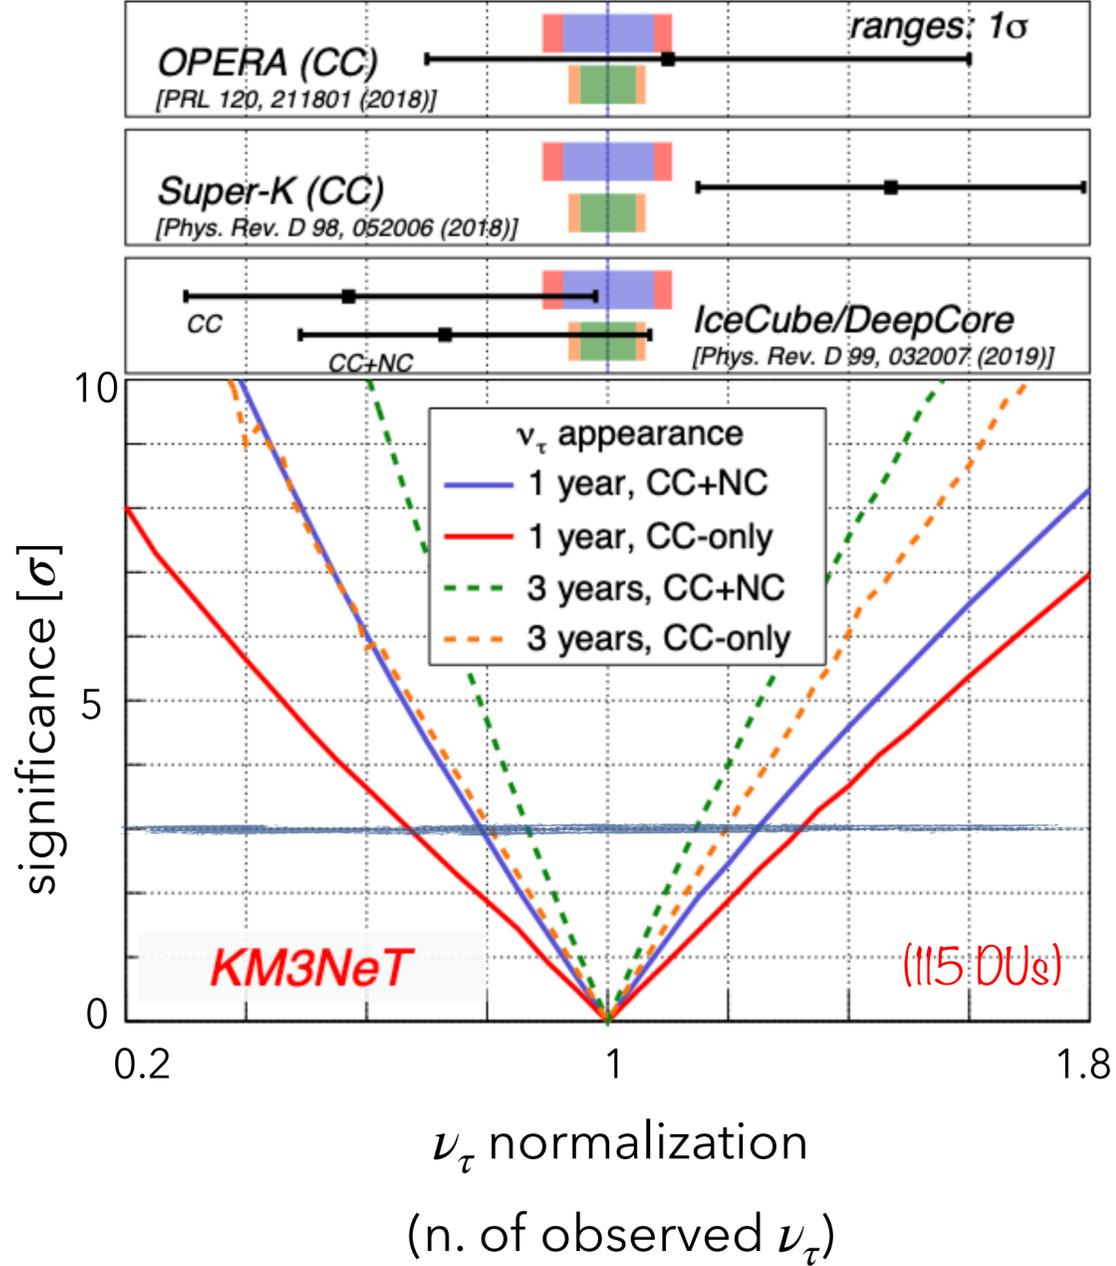

Sensitivity to ν_τ -appearance in full KM3NeT/ORCA

- using unitarity (hypothesis of ν_τ norm = 1)
 - 3000 ν_τ events/year in full ORCA
 - search for an **excess in the shower sample** (a good shower reconstruction is critical!)

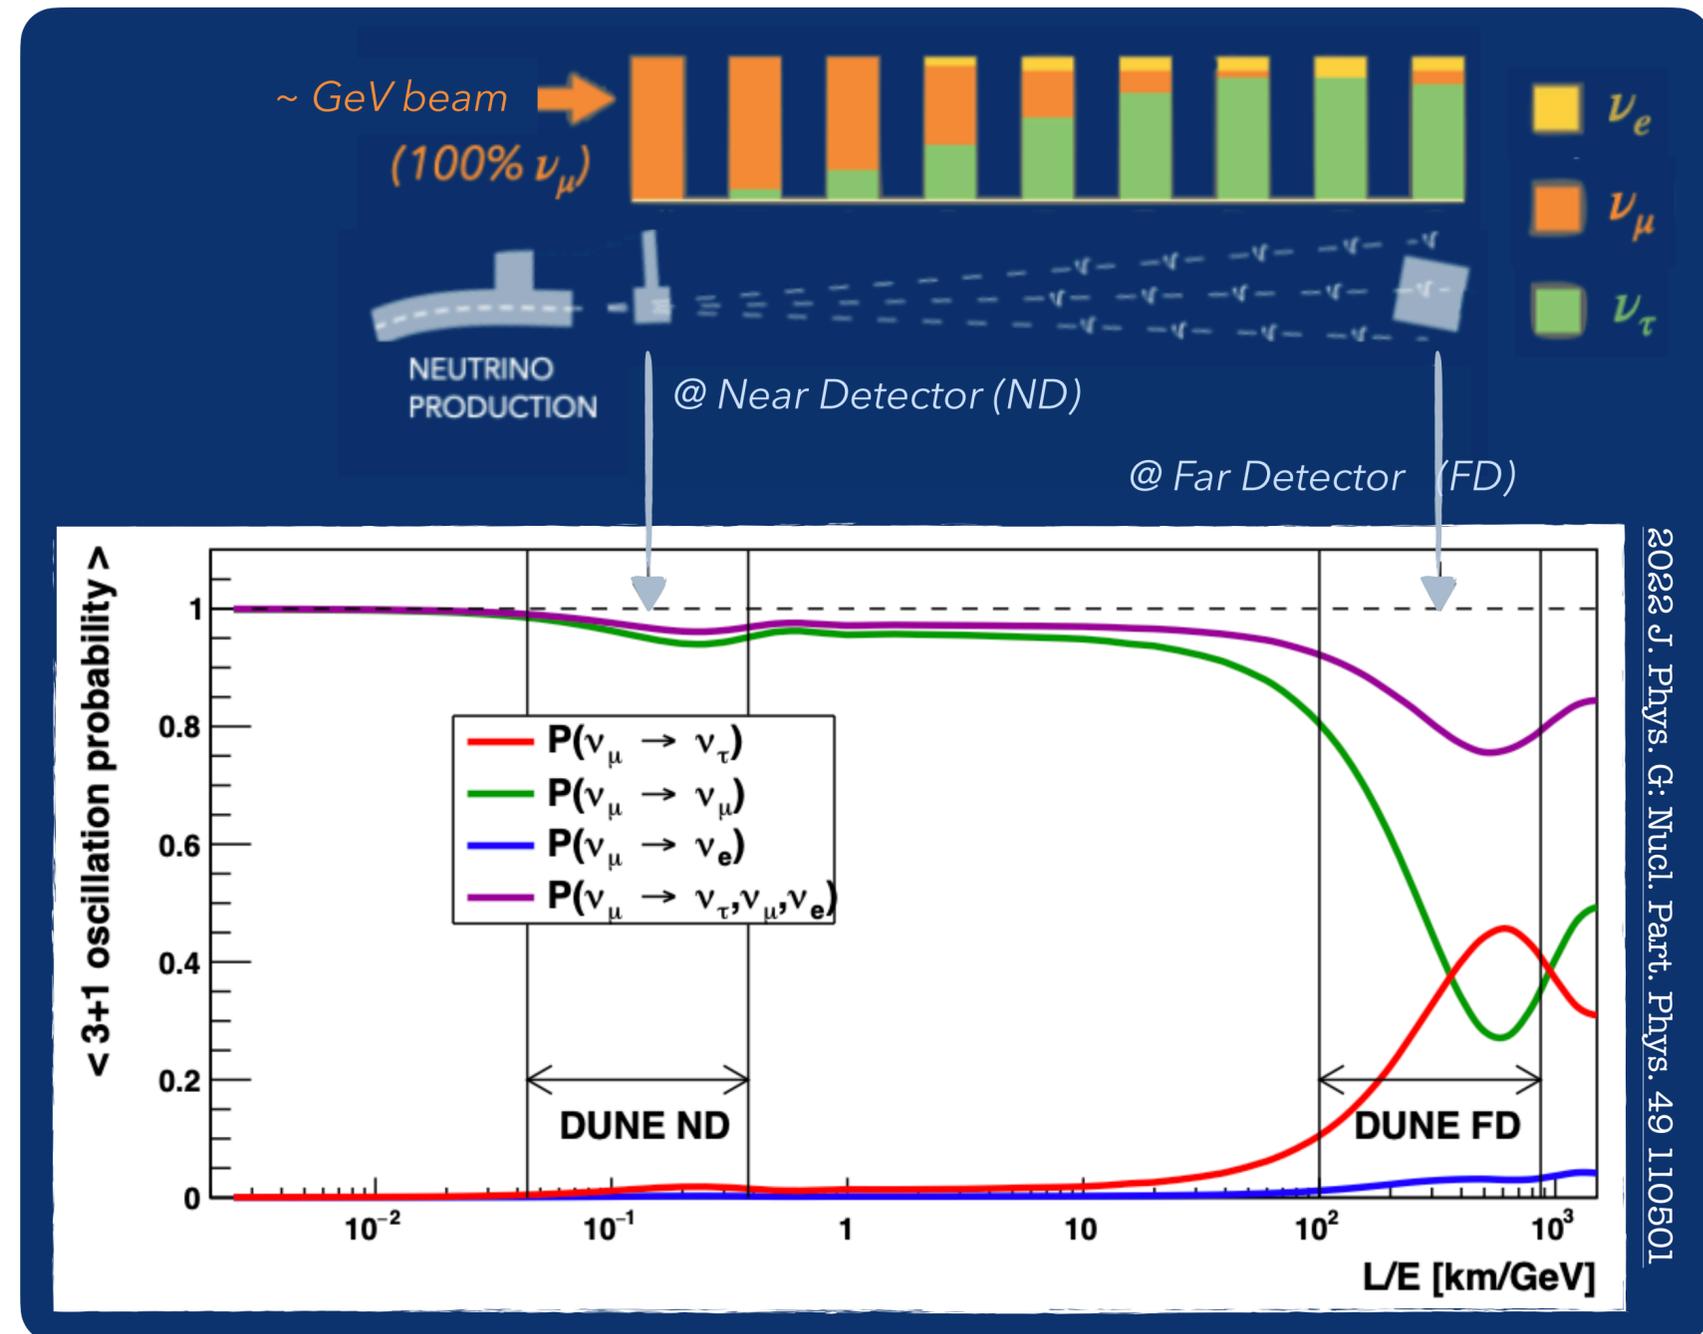

Eur. Phys. J. C (2022) 82: 26

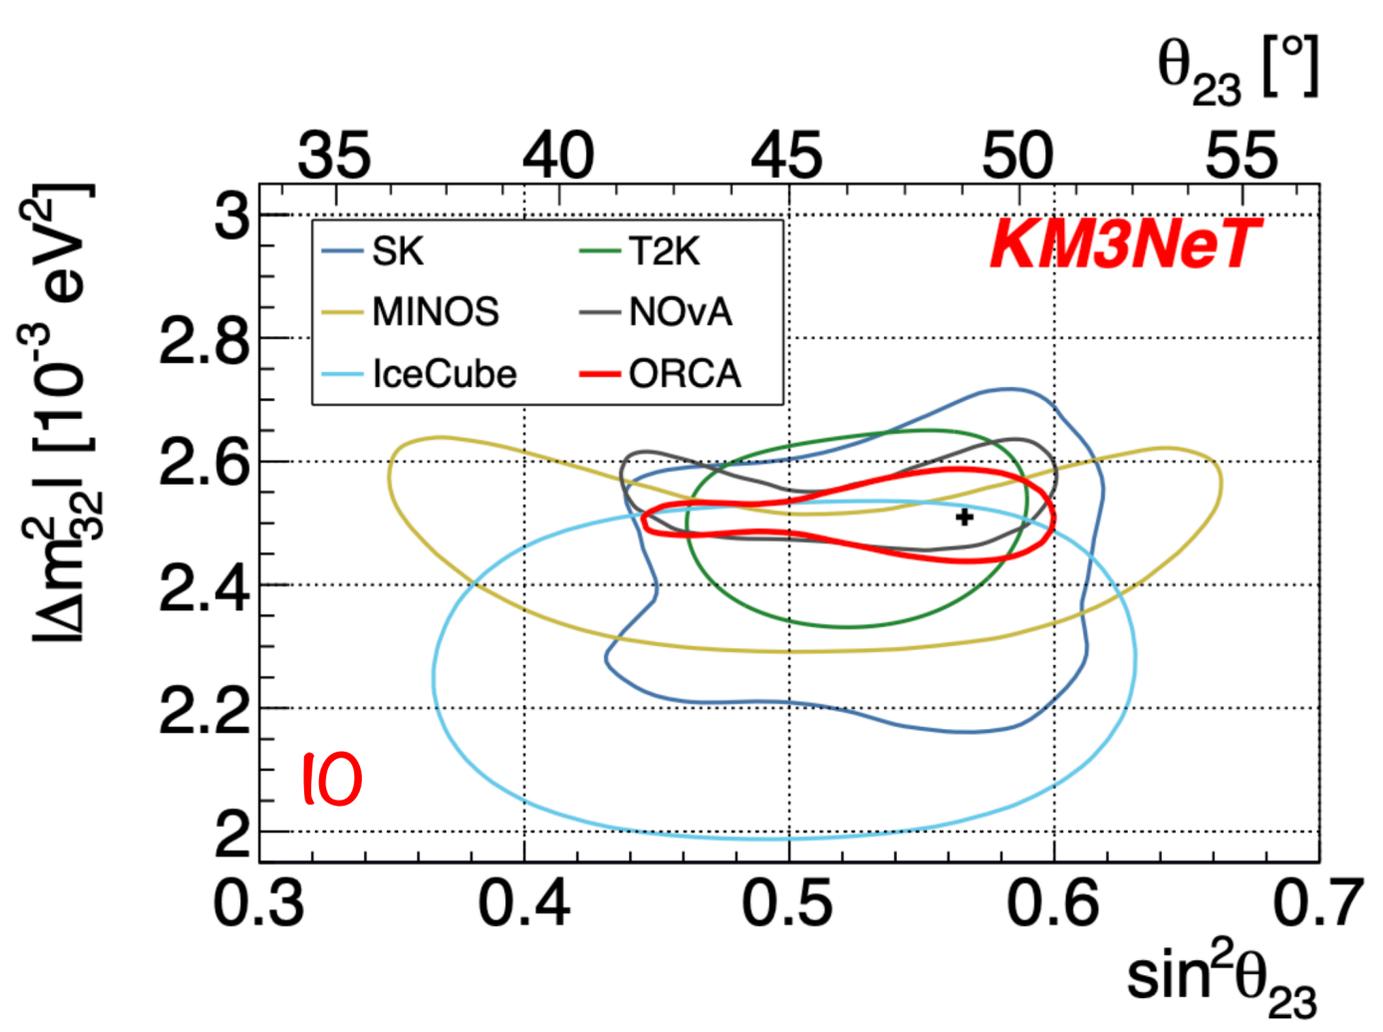

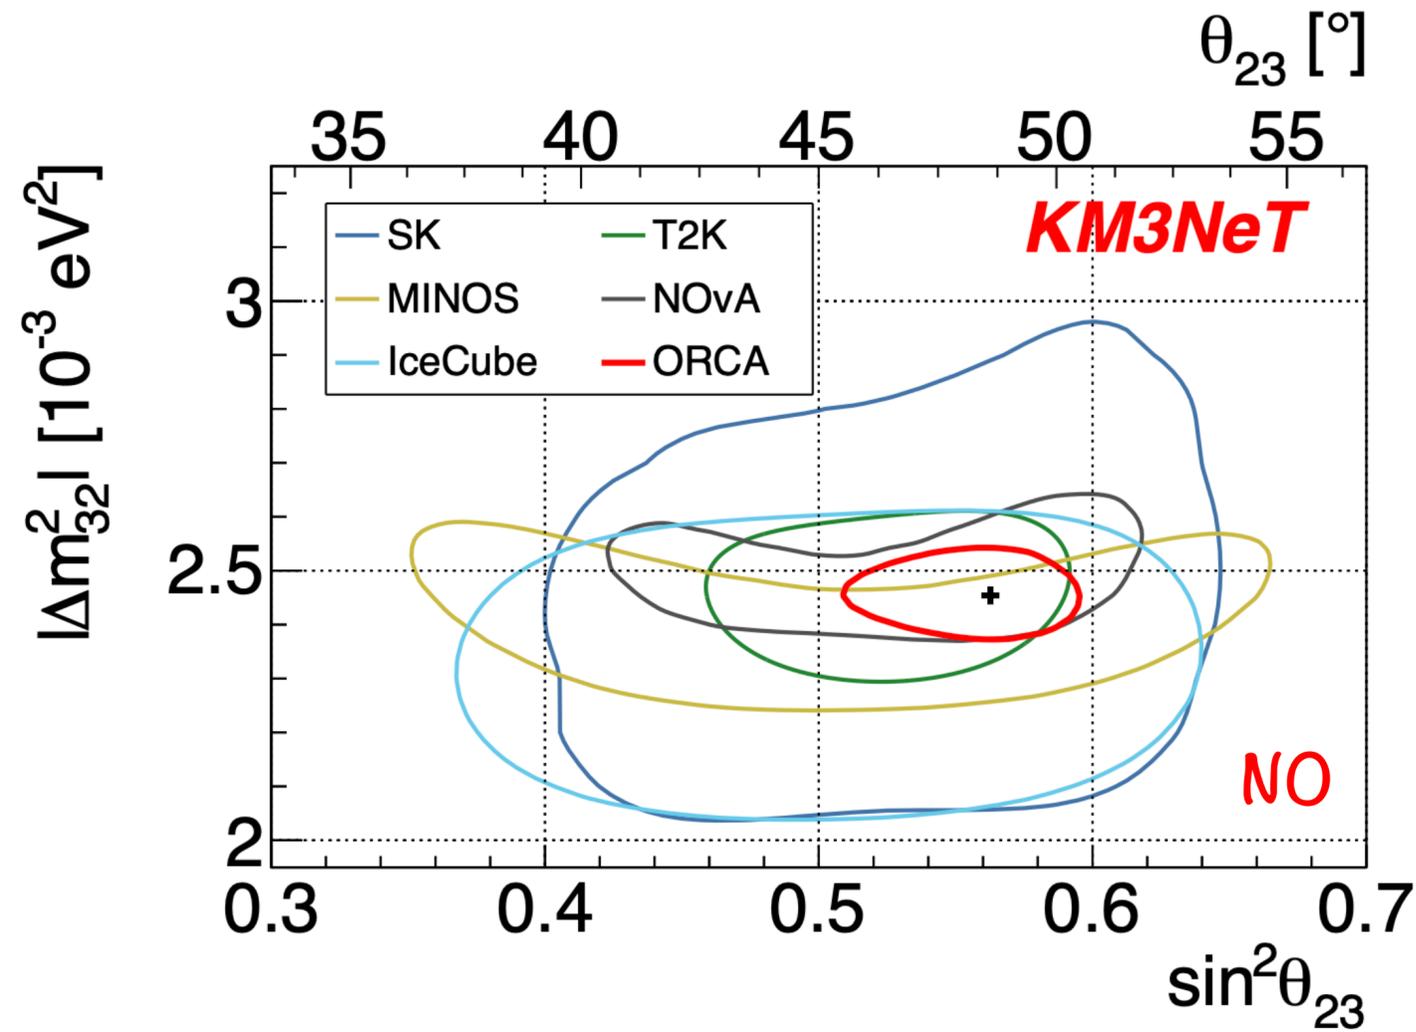

The ν_τ -appearance channel

- long-baseline accelerator neutrino experiments such as DUNE
 - remarkable event reconstruction and powerful neutrino beam
 - possible both at near and at far detector

Sensitivity in full KM3NeT/ORCA

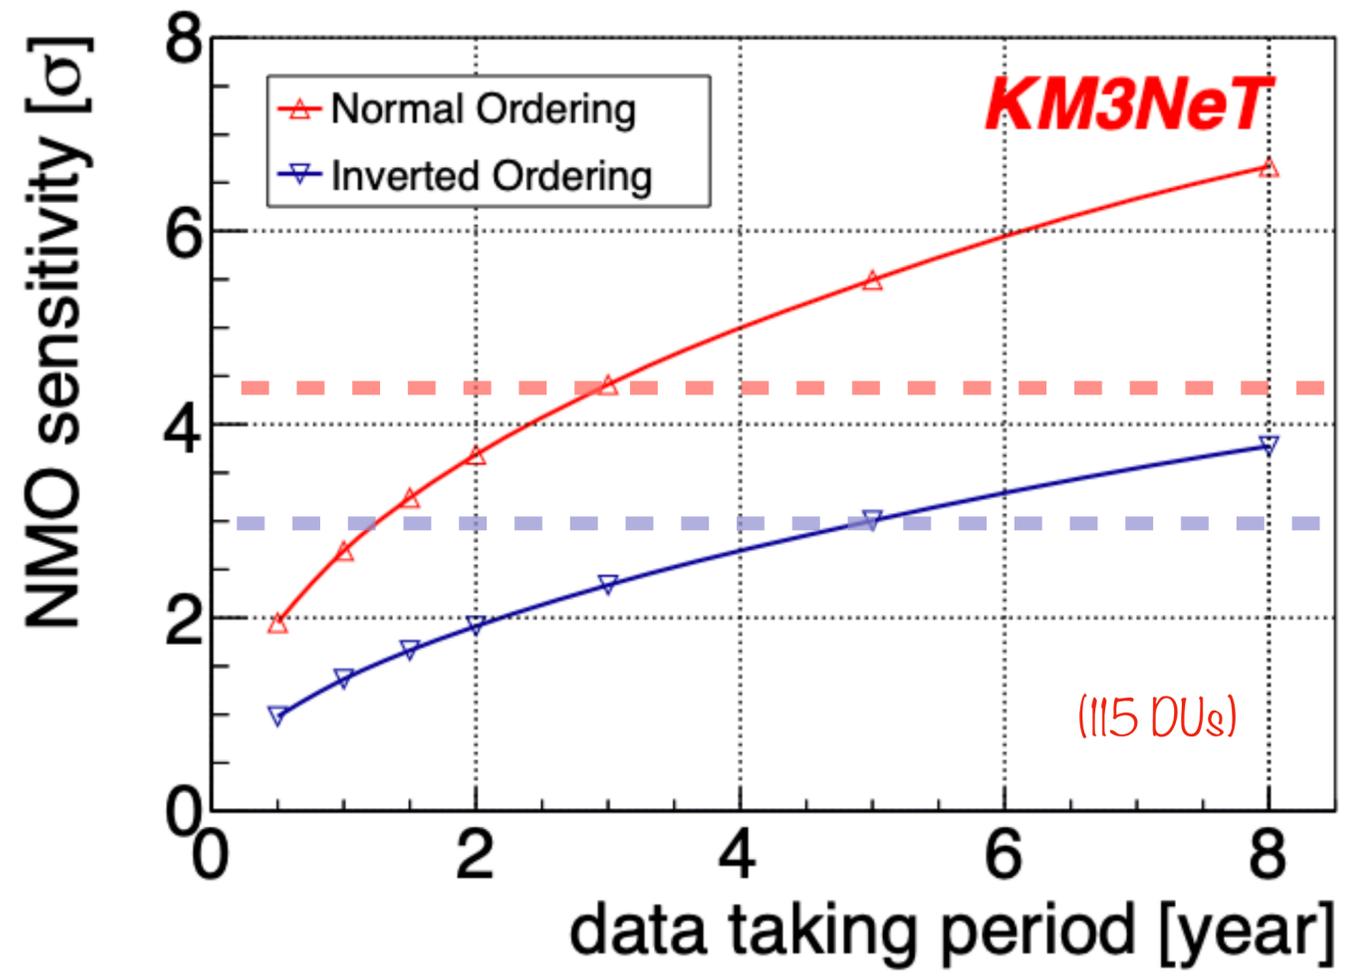

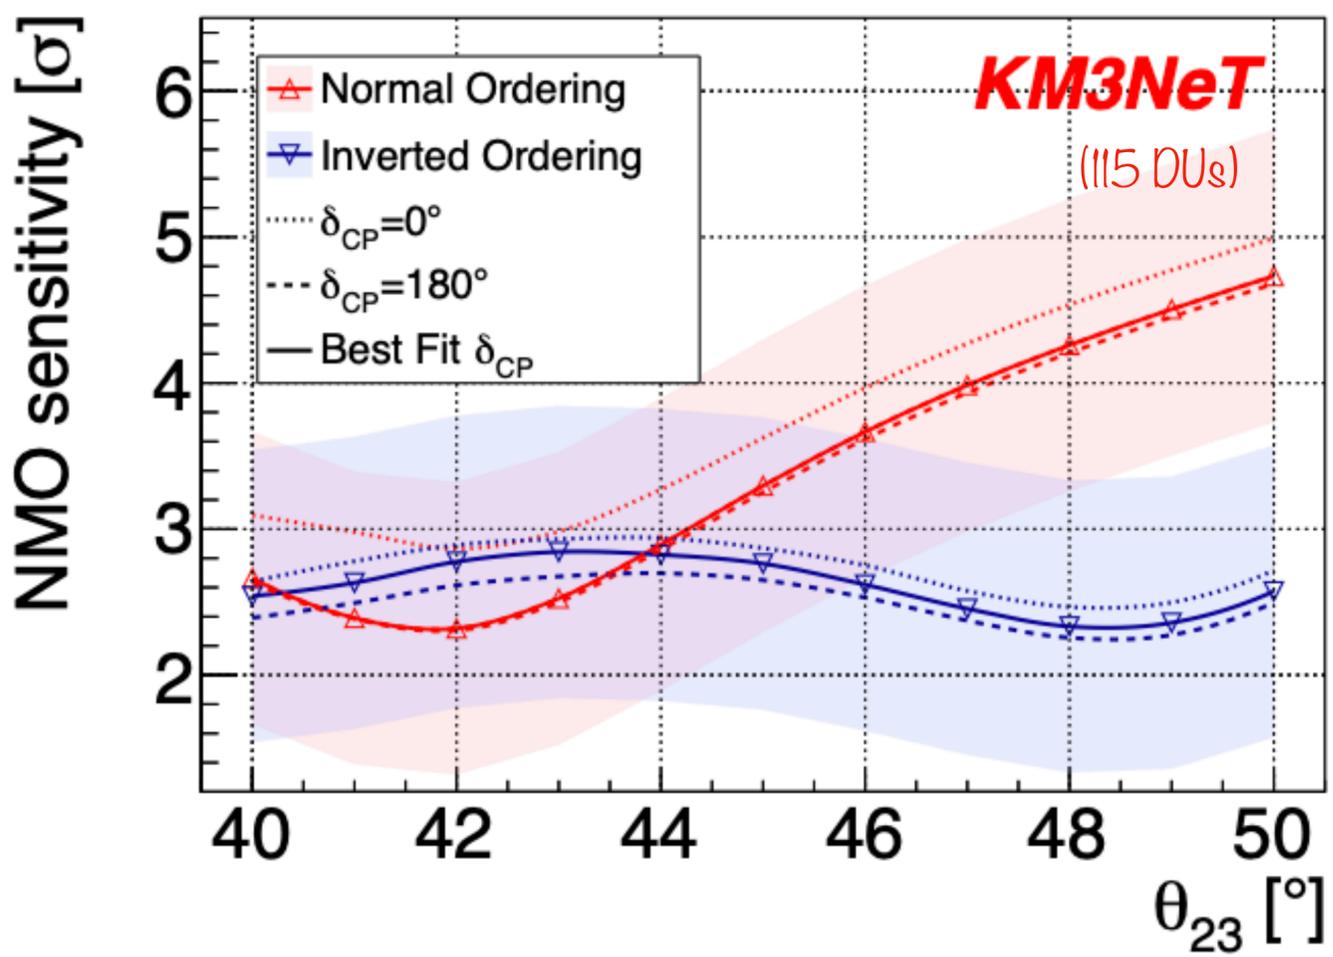

- Neutrino oscillation parameters: θ_{23} and Δm_{32}^2
 - Normal Ordering (NO) hypothesis on the left and Inverted Ordering (IO) hypothesis on the right

Expected KM3NeT/ORCA precision after 3 years of data taking at 90% of C.L.

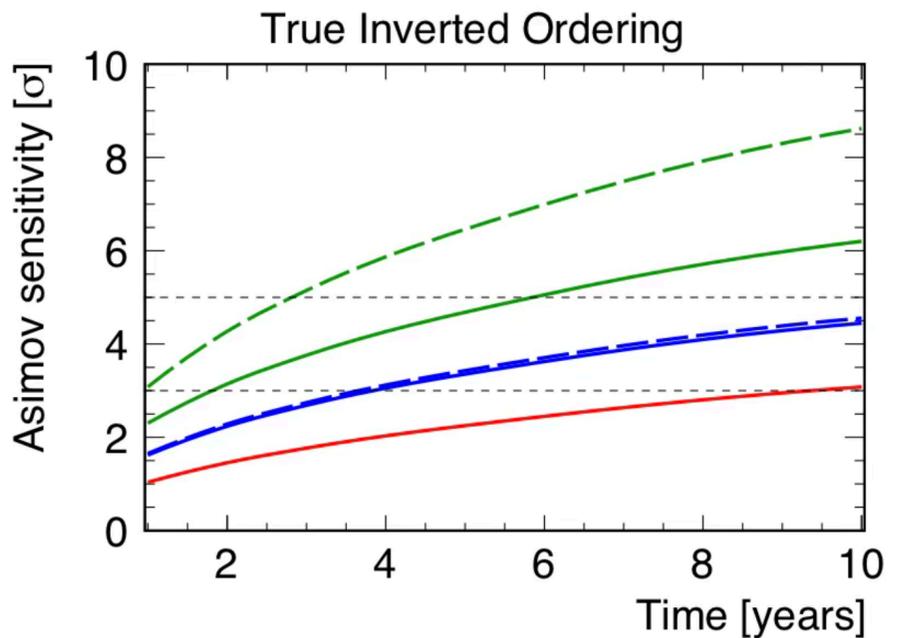

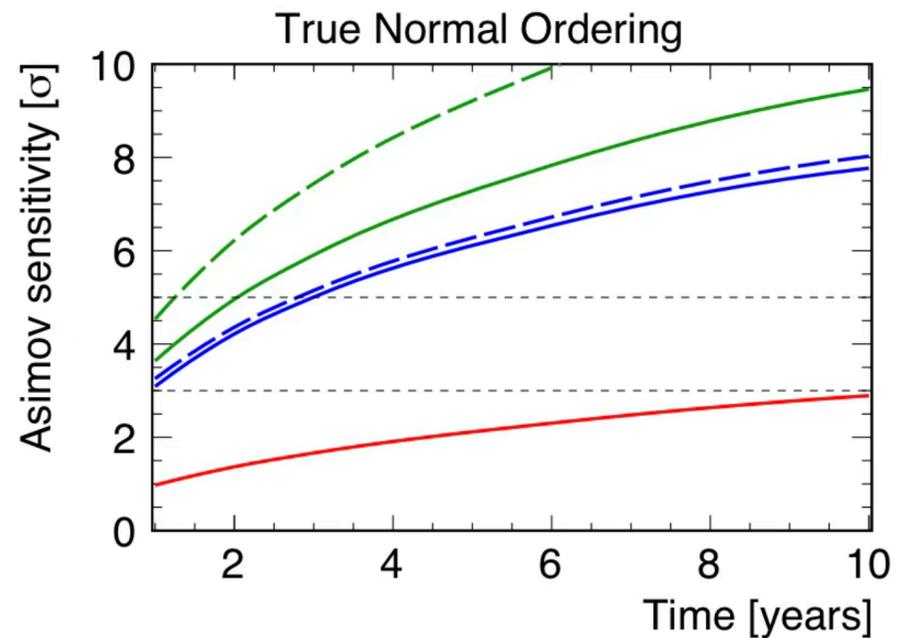

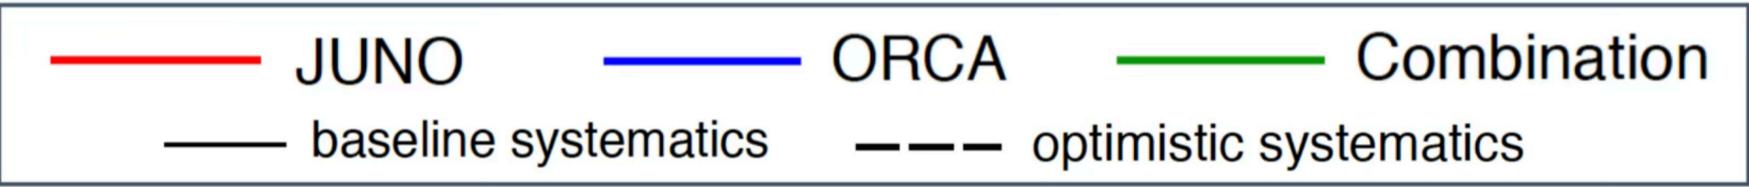

Sensitivity in full KM3NeT/ORCA

- Neutrino Mass Ordering (NMO):
 - after 3 years of data taking, 4.4σ if NO with the current best-fit oscillation parameters
 - 3σ sensitivity to IO, after 5 years of data taking

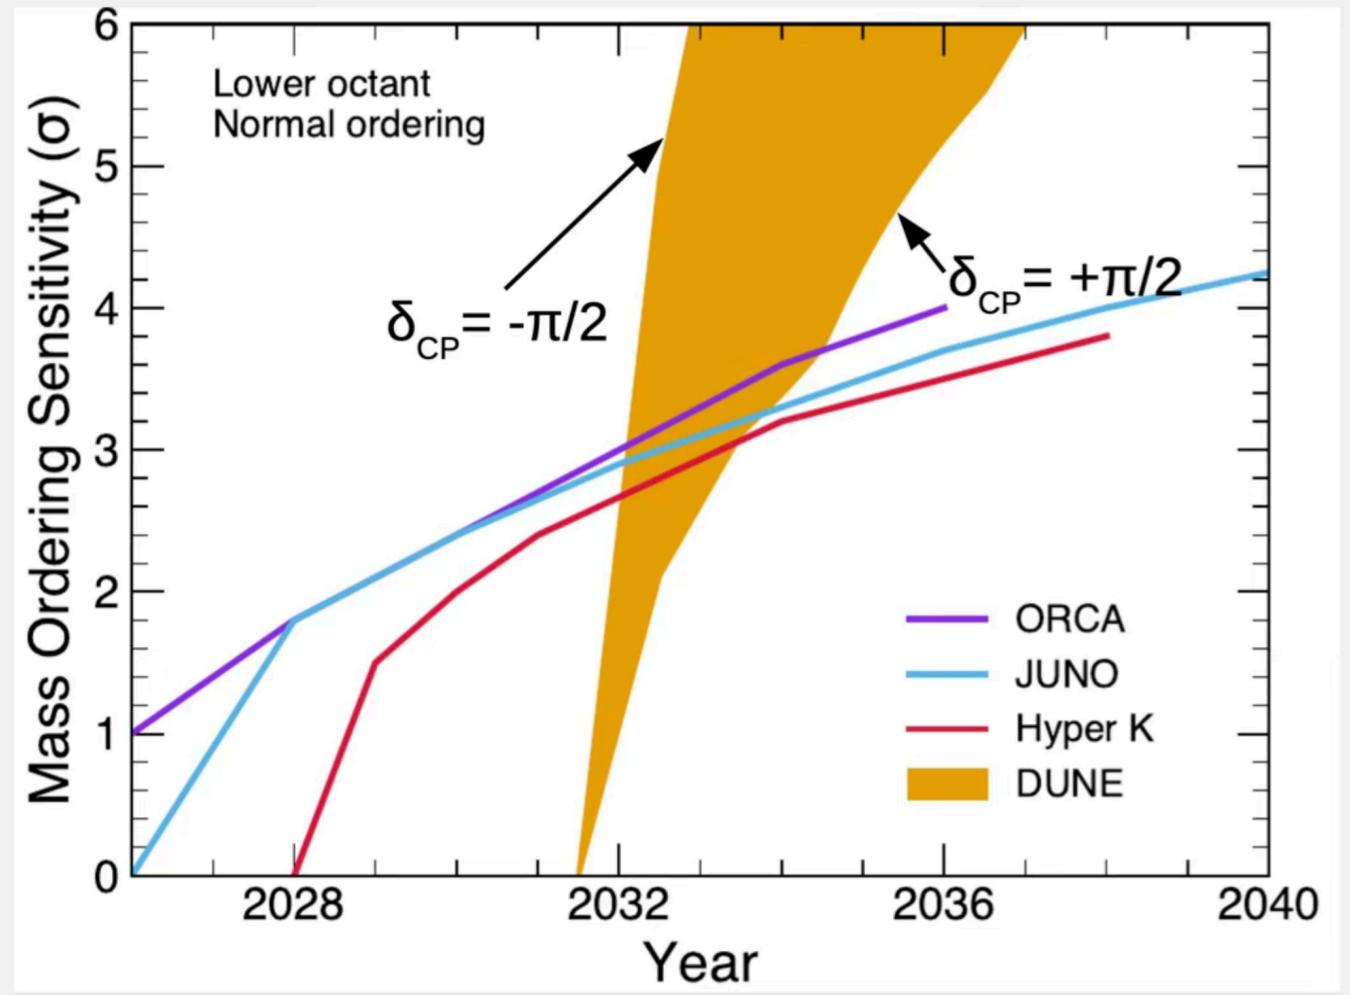

NMO sensitivity in/with other experiments

KM3NeT Collab., JHEP 2022 55 (2022)

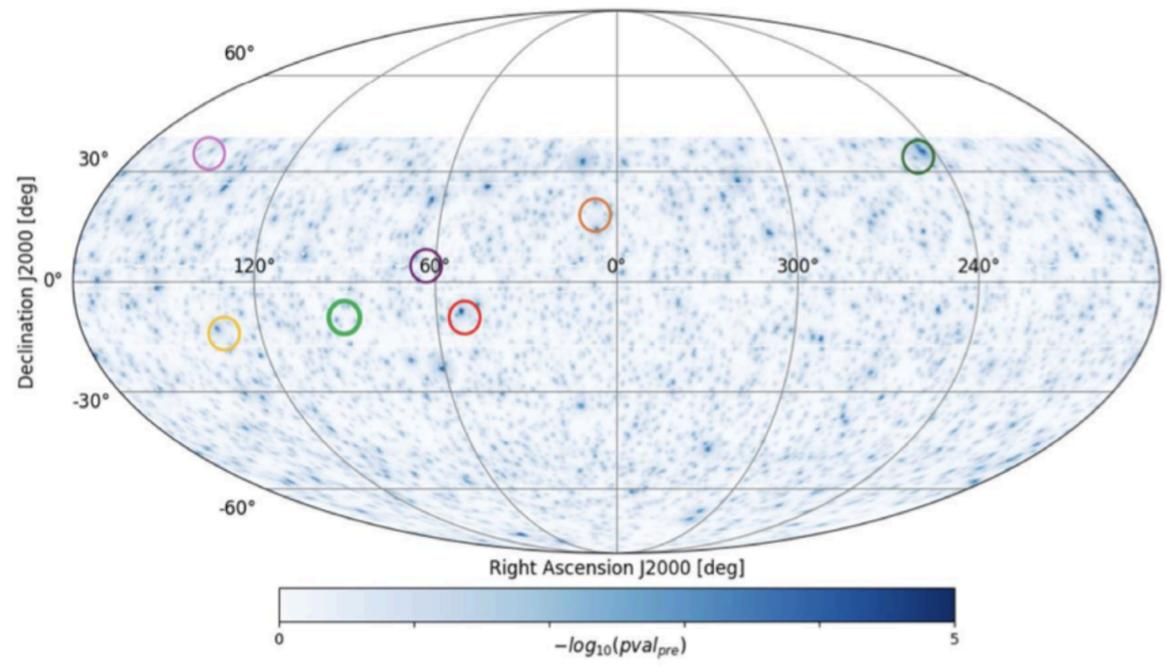

CERN Seminar on DUNE experiment - I. Gil-Botella

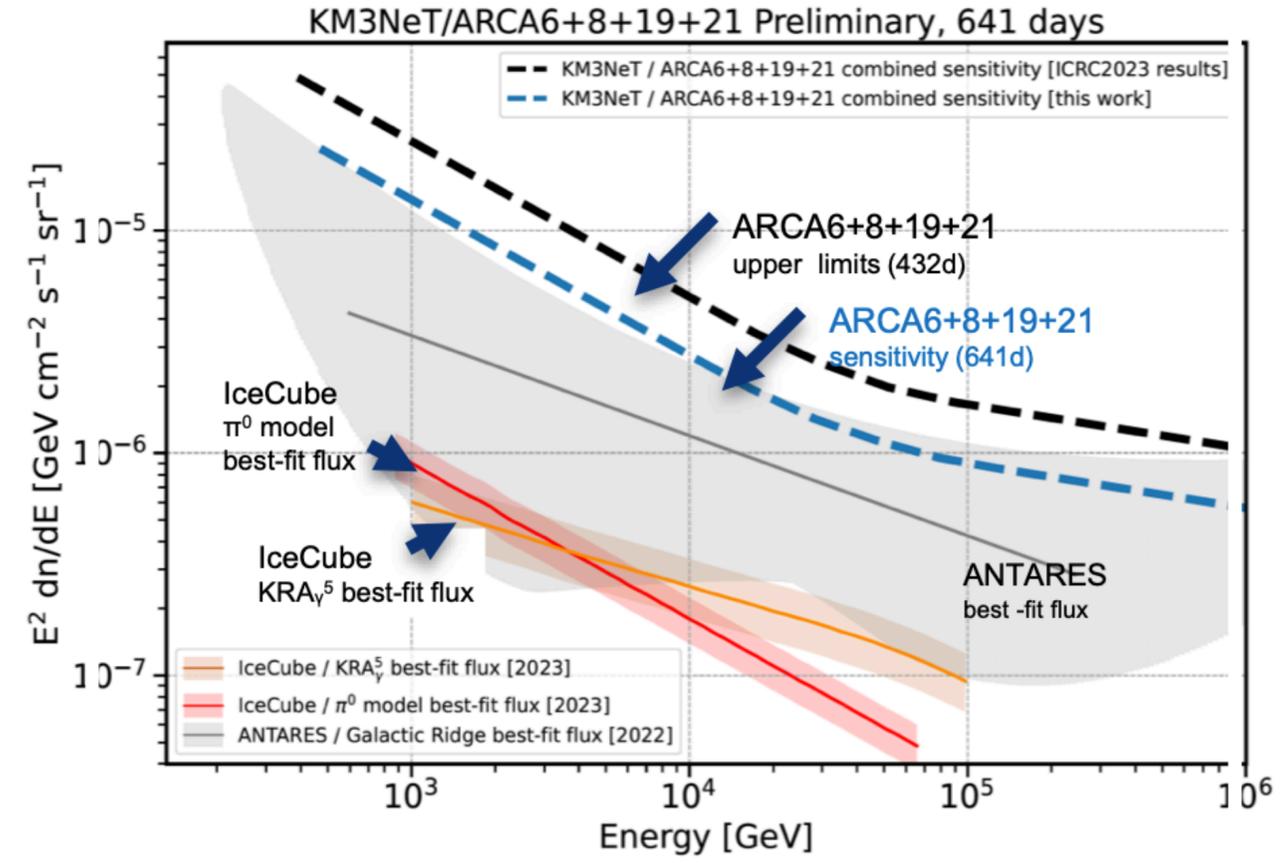

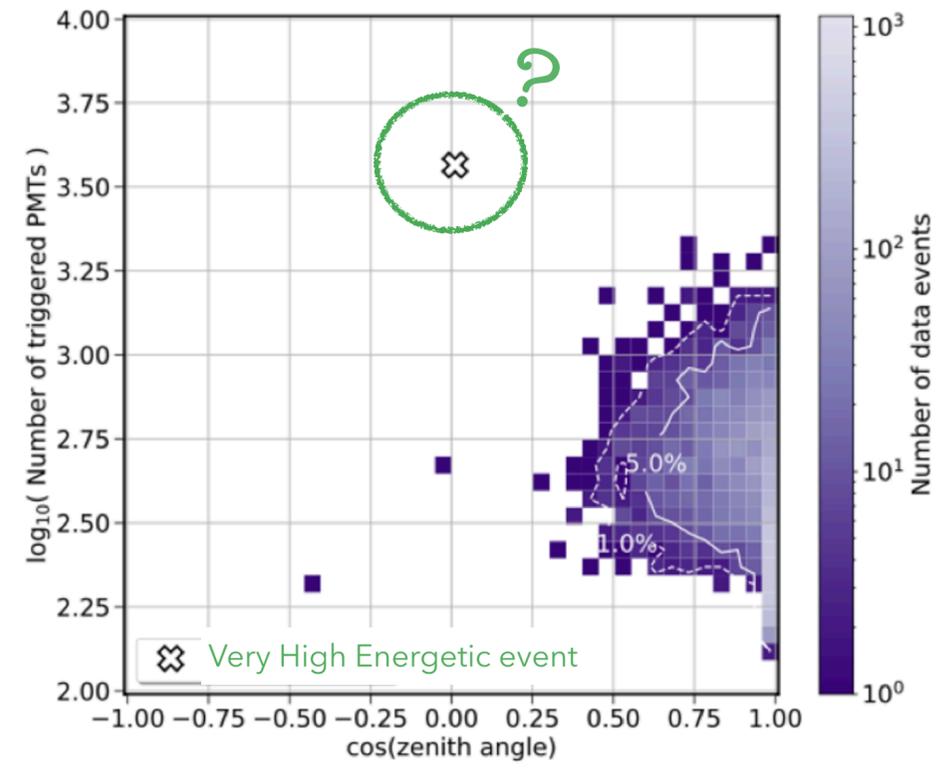

Main physics results in ARCA21

- Combined geometry analyses: ARCA 6+8+19+21
 - point source searches
 - diffuse astronomical neutrino flux ($E_\nu > 1\text{TeV}$)

"and, here, I have this event in data that I can't cut away...!" 🙋

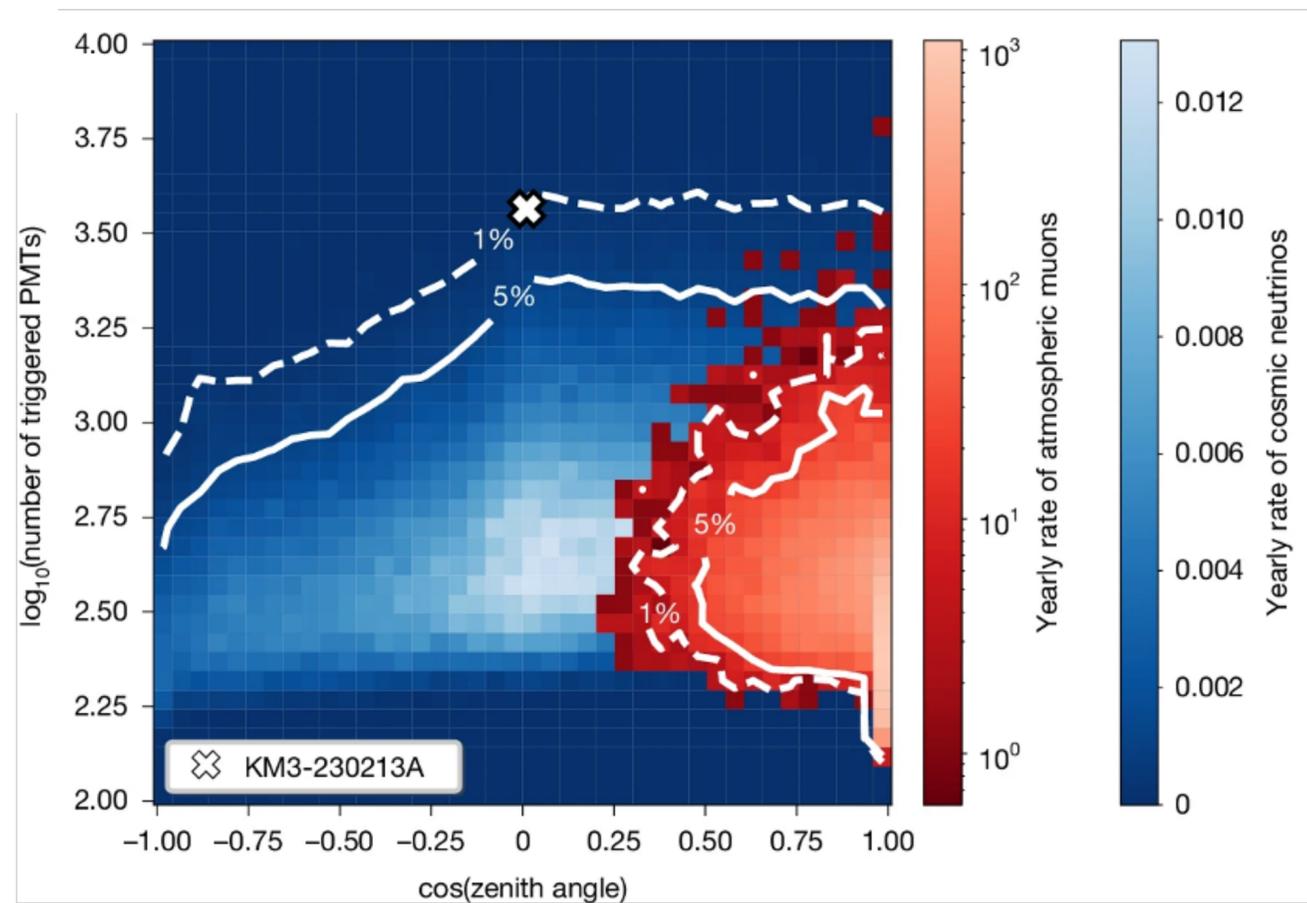

- Detected sources**
- CGCG 420-015
 - J0854+2006
 - J1613+3412
 - Mkn_421
 - J1337-1257
 - Very High Energetic event

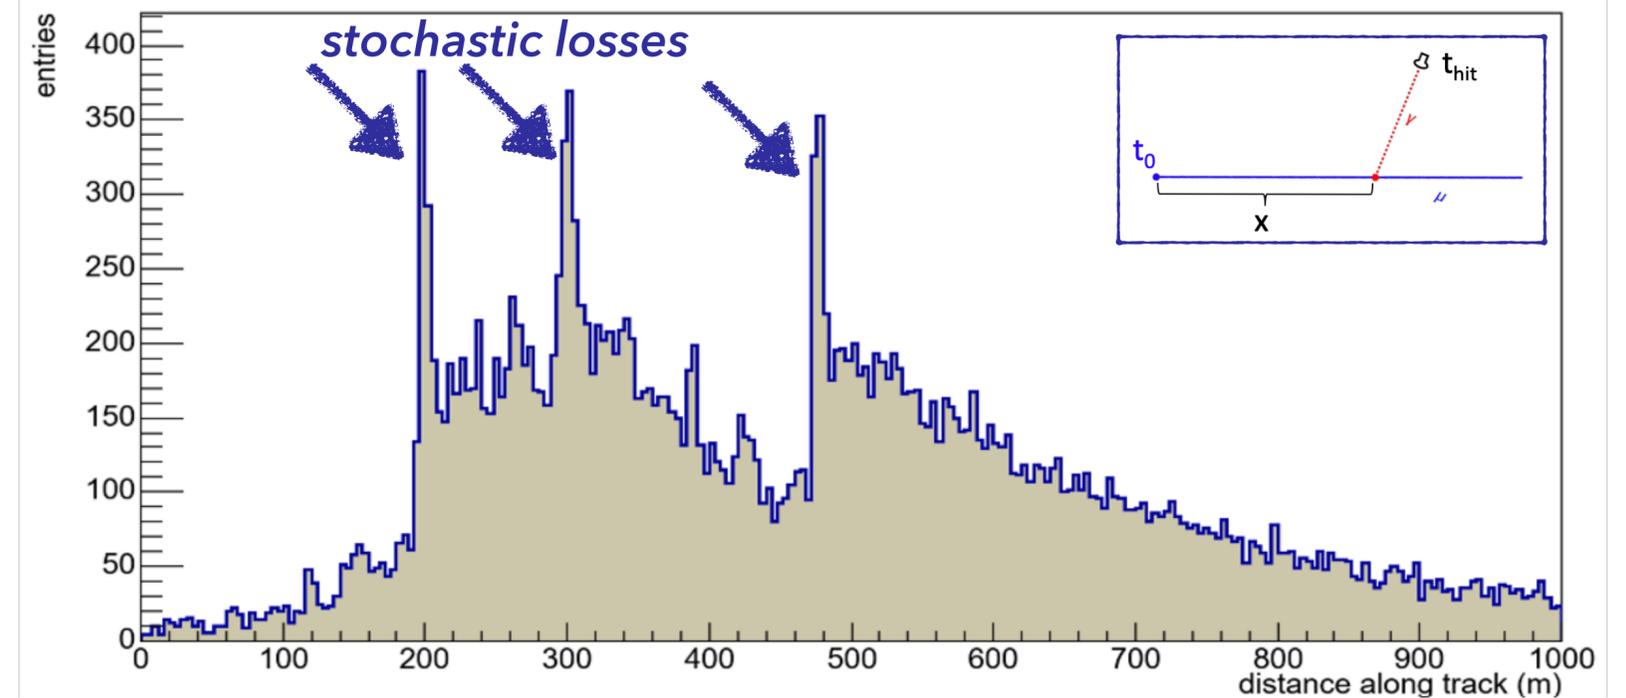

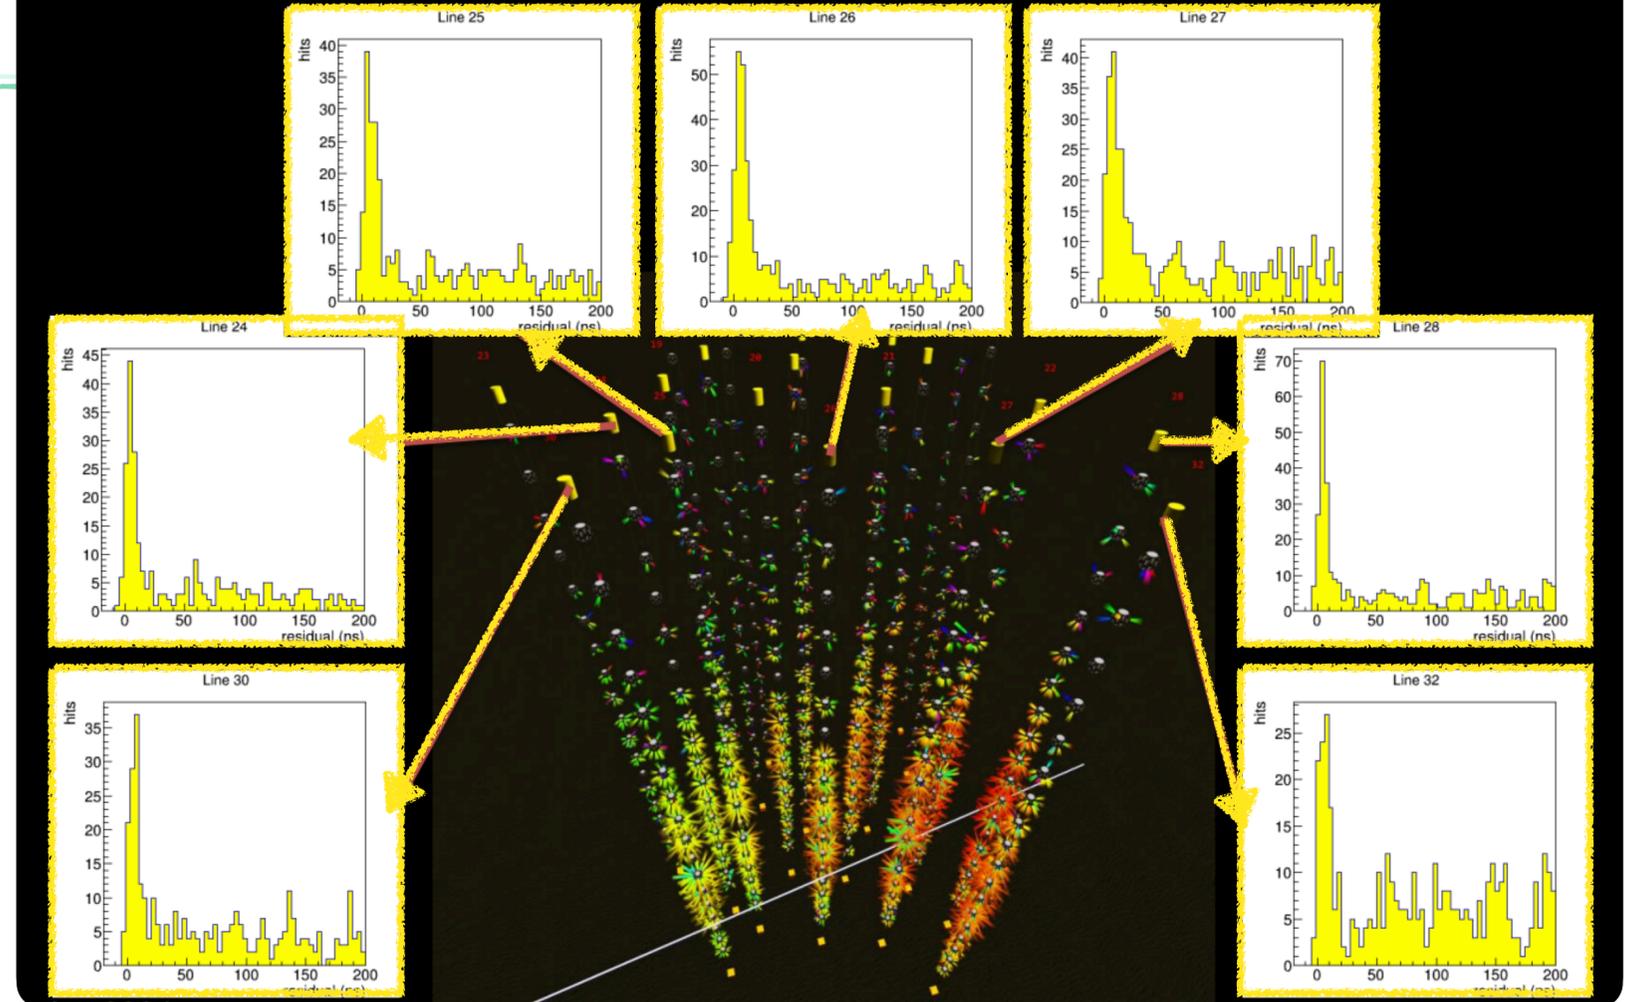

e.g. check out KM3NeT contributions at Neutrino 2024

The VHE event: KM3-230213A

- very well reconstructed Very-High Energetic (VHE) muon crossing ARCA21 detector
- consistent light profile in each DU
- three clear stochastic losses, typical of VHE muon
- ..outside the known signal-background phase space

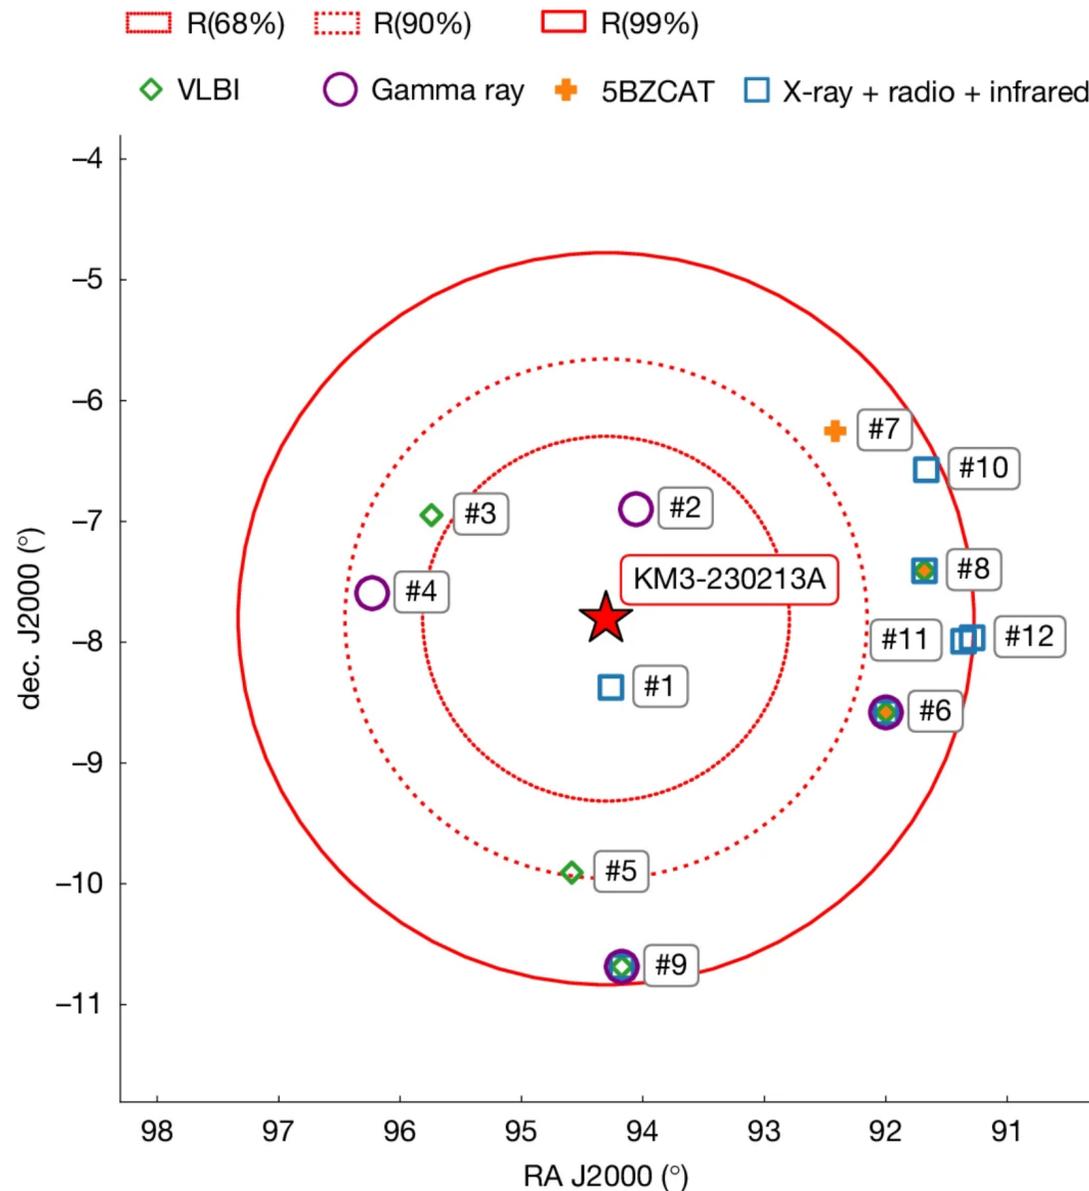

Event display

The VHE event: KM3-230213A

- Sky map in the direction on the KM3-230213A

- **considered hypotheses (to be confirmed)**

- produced in cosmic higher-energy accelerator
(Active Galactic Nuclei, associated with massive black hole)
- first cosmogenic neutrino ever detected

- **discarded hypotheses (most probably)**

- produced in the galactic plane (no matching compelling sources)
- flaring blazars (not conclusive yet)

- **Ongoing studies**

- improvement in the pointing calibration in ARCA detector
- (re-)analyse ARCA21 data

Bethe-Block reminder
