

# New Capabilities for Rucio

- Rucio is a distributed data management service originally created by ATLAS and now in use for CMS and DUNE.
- There is a Rucio instance at RAL and an ongoing digital asset to add features allowing it to support multiple experiments.
  - A related digital asset from Imperial is going to integrate Rucio with DIRAC
- This digital asset proposal will:
  - Add full support for object stores
  - Create a monitoring dashboard
- We have arranged a regular phone meeting between all the groups working on Rucio.
