

eMERLIN

e-MERGE Survey (e-MERLIN+JVLA) mas imaging of the μJy radio source population

Tier 0: Normal galaxies out to $z \sim 5$ (180hrs observations @1.2-1.7GHz) - *Deep imaging around clusters to utilise amplification by lensing*

Tier 1: *Deep high resolution imaging of the μJy radio sources in GOODS-N* e-MERGE: $\leq 200\text{mas}$ resolution over $\sim 0.2 \text{ deg}^2 \rightarrow \sim 5000$ galaxies

Tier 2: Shallow-wide survey over $\sim 2.0 \text{ sq-deg}$ – Piggyback on SuperCLASS Legacy Survey

Tier 1:

Detailed investigation of SF activity / AGN feedback

L-Band imaging of $30'$ field (200mas)

C-Band mosaic of the inner $12'$ field (35mas)

•

L-Band – Central $15'$ $1\sigma \sim 500\text{nJy/bm}$

Outer $30'$ annulus $1\sigma \sim 1\mu\text{Jy/bm}$

In full $30'$ field ~ 1500 AGN and ~ 3100 S-F galaxies complete to local $\sim 6\sigma$

Huge wide-field imaging exercise requiring $>1\text{TB}$ RAM to process
Large data-sets $>>20\text{TB}$ of raw data

e-MERGE DR-2 on IRIS..

Current DR-1 (inner 12arcmin) field imaging requires $\sim 700\text{-}800\text{GB}$ of memory to image efficiently using current widefield imaging techniques

DR-2 imaging will cover a field of $\sim 30\text{arcmin}$ and requires $>1\text{TB}$ memory
Similar very wide-field imaging to be applied to all data

New 'fat-note' IRIS compute resource for e-MERLIN & ALMA providing large memory is enhanced science delivery – test imaging underway on locally installed IRIS resource.

High memory nodes split between local (very easy access) and grid.
- Large Memory requirement ($>1\text{TB}$) for imaging.

Easy access route is important especially for interactive work on data

Resources are currently utilised for specific e-MERLIN & ALMA programmes before wider opening to e-MERLIN and ALMA communities

eMERGE DR2 testing imaging
